

## TPSM82480 5.5V 输入、6A 降压转换器模块

### 1 选项

- 超小型 7.9 x 3.6 x 1.5mm 电源模块
- 输出电流为 6A
- 反馈电压精度为  $\pm 1\%$
- 输入电压范围：2.4V 至 5.5V
- 输出电压范围：0.6V 至 5.5V
- 典型静态电流为 23 $\mu$ A
- 输出电压选择
- 相移操作
- 自动节能模式
- 强制 PWM 模式 选项
- 可调节软启动
- 电源正常和温度正常输出
- 欠压锁定
- 过流和短路保护
- 过热保护
- 工作温度范围：-40°C 至 125°C

### 2 应用

- 薄型负载点电源
- 存储、服务器、适配卡
- 工业 PC/嵌入式 PC/FPGA 电源
- 无线基站
- 测试和测量

典型应用电路原理图

### 3 说明

TPSM82480 是一款适用于低厚度负载点电源的同步降压直流/直流转换器模块。2.4V 至 5.5V 的输入电源范围使其既可以通过典型的 3.3V 或 5V 接口电源运行，也可以通过低至 2.4V 的备份电路运行。

输出电流最大可达 6A，由每相各为 3A 的两相电源持续提供，能够以异相运行，显著降低脉冲电流噪声。

TPSM82480 可在超轻负载时自动进入省电模式，并能保持高效率。其中包含自动增加/减少相位功能，具体使用一个相位还是两个相位视实际负载情况而定。可通过“模式”功能关闭省电模式。

器件可提供电源正常信号和可调软启动。此外，该器件还具有温度正常信号指示内部温度过高。通过 VSEL 引脚可将输出电压更改为预选值。TPSM82480 能够以 100% 的占空比模式运行。

### Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
VOUT1	1		Output Voltage Node Phase 1 (master), Must be connect with VOUT2
PGND1	2, 3, 20,21		Power Ground Phase 1 (master)
VIN1	4, 24		Supply voltage Phase 1 (master)
EN	5		Enable input (High=Enabled, Low = Disabled)
PG	6		Power Good (open drain, requires pull-up resistor)
VSEL	7		Output Voltage Select (High = VOUT2, Low=VOUT1) , VOUT1 < VOUT2
TG	8		Thermal Good (open drain, requires pull-up resistor)
MODE	9		Operating mode selection (Low=Automatic PWM/PSM, High = Forced PWM)
VIN2	10, 23		Supply voltage Phase 2
PGND2	11,12, 14, 22		Power Ground Phase 2
VOUT2	13		Output Voltage Node Phase 2, Must be connected with VOUT1
SS/TR	15		Soft-Start / Tracking. An external capacitor connected to this pin sets the output voltage rise time.
AGND	16		Analog Ground
FB	17		Output voltage feedback for the adjustable version. Connect resistive voltage divider to this pin.
RS	18		Resistor Select. Connect resistor that sets the level for the second output voltage here (activated by VSEL= High)
VO	19		VOUT detection (connect to VOUT, output discharge is internally connected to this pin)

## 6 Specifications

### 6.1 Absolute Maximum Ratings

		MIN	MAX	UNIT
Pin Voltage Range <sup>(1)</sup>	VIN	-0.3	6	V
	EN, VSEL, MODE, SS/TR, PG, TG	-0.3	6	V
	FB, RS	-0.3	3	V
Power Good / Thermal Good Sink Current	PG, TG		10	mA
Operating Junction Temperature Range, T <sub>J</sub>		-40	150	°C
Storage Temperature Range, T <sub>stg</sub>		-65	150	°C

(1) All voltages are with respect to network ground terminal.

### 6.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	±1000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

	MIN	TYP	MAX	UNIT
Supply Voltage Range, V <sub>IN</sub>	2.4		5.5	V
Output Voltage Range, V <sub>OUT</sub>	0.6		5.5	V
Maximum Output Current, I <sub>OUT</sub>	6			A
Operating junction temperature, T <sub>J</sub>	-40		125	°C

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPSM82480	UNIT

- (1) The output voltage accuracy in Power Save Mode can be improved by increasing the output capacitor value, reducing the output voltage ripple.
- (2) For detailed information on output discharge see [Active Output Discharge](#).

## 6.6 Typical Characteristics

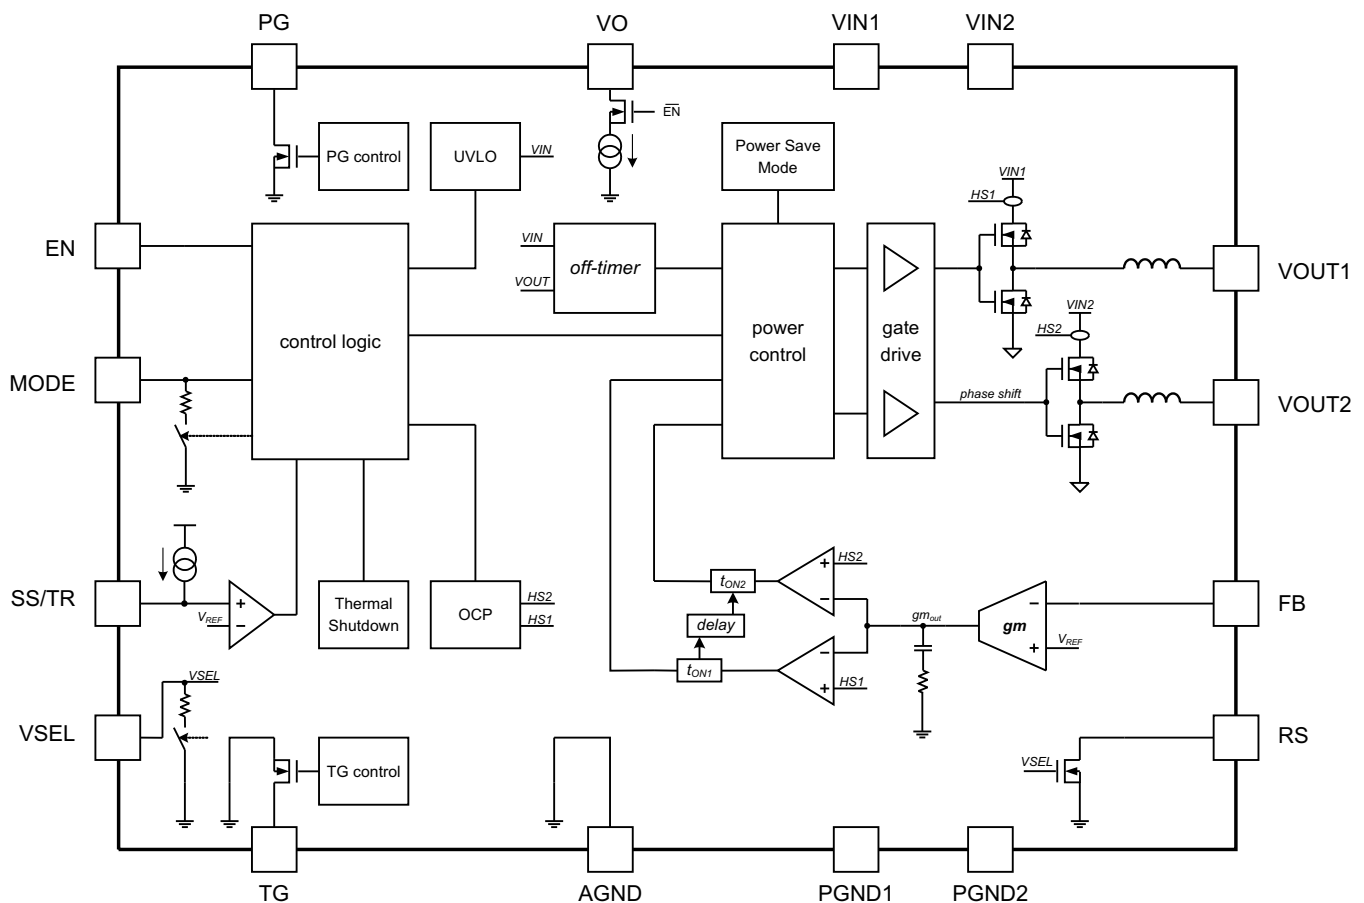

## 7 Detailed Description

### 7.1 Overview

The TPSM82480 is a high efficiency synchronous switched mode step-down converter module based on a 2-phase peak current control topology. It is designed for smallest solution size low-profile applications, converting a 2.4 V to 5.5 V input voltage into a lower 0.6 V to 5.5 V output voltage. While an outer voltage loop sets the regulation threshold for the inner current loop, based on the actual  $V_{OUT}$  level, the inner current loop regulates to the actual peak inductor current level for every switching cycle. The regulation network is internally compensated. While the ON-time is determined by duty cycle, inductance and cycle peak current, the switching frequency of typically 2.2 MHz is set by a predicted OFF-time. The device features a Power Save Mode (PSM) to keep the conversion efficiency high over the whole load current range.

The TPSM82480 is a 2-phase converter, sharing the load among the phases. Identical in construction, the second phase control is connected with an adaptive delay to the first phase. Both the phases use the same regulation threshold and cycle-by-cycle peak current setpoint. This ensures a phase-shifted as well as current-balanced operation. Using the advantages of the 2-phase topology, a 6-A continuous output current is provided with high performance and as small as possible solution size.

**图 6. TPSM82480**

## 7.3 Feature Description

### 7.3.1 Enable / Shutdown (EN)

The device starts operation, when VIN is present and enable (EN) is set High. Since the boundary EN thresholds are specified with 1.2 V for rising and 0.4 V for falling voltages, the typical values are 0.85 V (rising) and 0.65 V (falling). The device is disabled by pulling EN Low. Leaving the EN pin floating is not recommended.

### 7.3.2 Soft Start (SS), Pre-biased Output

The internal soft start circuit controls the output voltage slope during startup. This avoids excessive inrush current and provides an adjustable controlled output-voltage rise time. The soft start also prevents unwanted voltage drop from high impedance power sources or batteries.

When EN is set to start device operation, the device starts switching after a delay of typically 200  $\mu$ s and VOUT rises with a slope, controlled by the external capacitor which is connected to the SS/TR pin (soft start). Leaving the SS/TR pin floating or connecting to VIN provides internally set fastest startup with a soft start slope of about 80us. See [Application Curves](#) for typical startup operation.

The device can start into a pre-biased output. In this case, the device starts switching, only when the internal set point for VOUT increases above the pre-biased voltage level.

### 7.3.3 Tracking (TR)

The device tracks an external voltage applied to the SS/TR pin. The FB voltage tracks the external voltage as long as it is below about 0.6V. Above 0.6V the device goes to normal operation. If the voltage at the SS/TR pin decreases below about 0.6V, the FB voltage tracks again this voltage. See [Tracking](#) for further details.

### 7.3.4 Output Voltage Select (VSEL)

A resistive divider (VOUT to FB to AGND) sets the output voltage of the TPSM82480. Providing a logic High level at the VSEL pin, the RS pin is pulled to ground, so that a resistor, between FB and RS pins is connected in parallel to the lower resistor of the divider. This sets a different higher output voltage and can be used for dynamic voltage scaling (see [Setting  \$V\_{OUT2}\$  Using the VSEL Feature](#)).

If the VSEL pin is set Low, the device connects an internal pull down resistor to the pin, keeping the internal logic level Low, even if the pin is floating afterwards. The device disconnects the resistor, if the pin is set to High.

### 7.3.5 Forced PWM (MODE)

To avoid [Power Save Mode \(PSM\) Operation](#), the device can be forced to PWM mode operation by pulling the MODE pin High. In this case the device operates continuously with it's nominal switching frequency and the minimum peak current can go as low as -500 mA.

If the MODE pin is set Low, the device connects an internal pull down resistor to keep the internal logic level Low, even if the pin is floating afterwards. The device disconnects the resistor, if the pin is set to High.

### 7.3.6 Power Good (PG)

The TPSM82480 has a built in power good function. The PG pin goes High, when the output voltage has reached its nominal value. Otherwise, including when disabled, in UVLO or thermal shutdown, PG is Low. The PG pin is an open drain output that requires a pull-up resistor and can sink typically 2mA. If not used, the PG pin can be left floating or grounded.

### 7.3.7 Thermal Good (TG)

As long as the junction temperature of the TPSM82480 is below the thermal good temperature of typically 120°C, the logic level at the TG pin is High. If the junction temperature exceeds that temperature, the TG pin goes Low. This can be used for the system to take action preventing excessive heating or even thermal shutdown. The TG pin is an open drain output that requires a pull-up resistor and can sink typically 2mA. If not used, the TG pin can be left floating or grounded.

## Feature Description (接下页)

### 7.3.8 Active Output Discharge

The VO pin, connected to the output voltage, provides an active discharge path when the device is switched off by setting EN Low or UVLO event. In case of being activated, this discharge circuit sinks typically 120mA for output voltages of typically 1 V and above. If  $V_{OUT}$  is lower, the active current sink enters linear operation mode and the discharge current decreases.

### 7.3.9 Undervoltage Lockout (UVLO)

The undervoltage lockout prevents misoperation of the device, if the input voltage drops below the UVLO threshold which is set to typically 2.3 V. The converter starts operation again once the input voltage exceeds the threshold by a hysteresis of typically 200 mV.

### 7.3.10 Thermal Shutdown

The junction temperature ( $T_J$ ) of the device is monitored by an internal temperature sensor. If  $T_J$  exceeds 160°C (typical), the device goes in thermal shutdown with a hysteresis of about 10°C. Both the power FETs are turned off and the PG pin goes Low. Once  $T_J$  has decreased enough, the device resumes normal operation with Soft Start.

## 7.4 Device Functional Modes

### 7.4.1 Pulse Width Modulation (PWM) Operation

The TPSM82480 is based on a predictive OFF-time peak current control topology, operating with PWM in continuous conduction mode for current loads larger than half the ripple current. The switching frequency is typically 2.2MHz. Both the master and follower phase regulate to the same VOUT level, each with a separate current loop, using the same peak current set point, cycle by cycle. This provides excellent peak current balancing, independent of inductor dc resistance matching. Since the follower phase operates with an adaptive delay to the master phase, phase shifted operation is always obtained. If the load current decreases, the device runs with the master phase only (see [Phase Add/Shed and Current Balancing](#)).

PWM only mode can be forced by pulling MODE pin High. If MODE is set Low, the device features an automatic transition into Power Save Mode, entered at light loads, running in discontinuous conduction mode (DCM).

### 7.4.2 Power Save Mode (PSM) Operation

As the load current decreases to half the ripple current, the converter enters Power Save Mode operation. During PSM, the converter operates with reduced switching frequency maintaining high conversion efficiency. Power Save Mode is based on an adaptive peak current target, to keep output voltage ripple low. Since each pulse shifts  $V_{OUT}$  up, a pause time happens until  $V_{OUT}$  trips the internal  $V_{OUT\_Low}$  threshold again and the next pulse takes place.

The switching frequency in PSM (one phase operation) calculates as:

$$f_{SW(PSM)} = \frac{2 \cdot I_{OUT} \cdot V_{OUT} (V_{IN} - V_{OUT})}{L \cdot I_{PEAK}^2 \cdot V_{IN}} \quad (1)$$

### 7.4.3 Minimum Duty Cycle and 100% Mode Operation

The minimum on-time, which is typically 70ns, normally determines a limit on the minimum operating duty cycle. The calculation is:

$$DC_{min} = 70ns \cdot 100\% \cdot f_{SW} [Hz] \quad (2)$$

However, a frequency foldback lowers the switching frequency depending on the duty cycle and ensures proper regulation for every duty cycle.

## Device Functional Modes (接下页)

There is no limit towards maximum duty cycle. When the input voltage becomes close to the output voltage, the device enters automatically 100% duty cycle mode and both high-side FETs switch on as long as V<sub>OUT</sub> remains below the regulation setpoint. In this case, the voltage drop across the high-side FETs and the inductors determines the output voltage level. An estimate for the minimum input voltage to maintain output voltage regulation is:

$$V_{IN(min)} = V_{OUT(min)} + I_{OUT} \left[ \frac{R_{DS(ON)}}{2} + 13.5m\Omega \right] \quad (3)$$

Where the maximum DCR of the inductors is 27mΩ.

In 100% duty cycle mode, the low-side FETs are switched off. The typical quiescent current in 100% mode is 3.5 mA.

### 7.4.4 Phase Shifted Operation

Using an inherent benefit of the two-phase conversion, the two phases of TPSM82480 run out of phase. For every switching cycle, the second phase is not allowed to turn on its high-side FET until the master phase has reached its peak current value. This limits the input RMS current and corresponding switching noise.

### 7.4.5 Phase Add/Shed and Current Balancing

When the load current is below the internal threshold, only the master phase operates. The second phase activates, if the load current exceeds the threshold of typically 1.7 A. The second phase powers off with a hysteresis of about 0.5 A, when the load current decreases.

### 7.4.6 Current Limit and Short Circuit Protection

Each phase has a separate integrated peak current limit. The dc values are specified in the [Electrical Characteristics](#). While its minimum value limits the output current of the phase, the maximum number gives the current that must be considered to flow in some operating case (e.g. overload). At the peak current limit, the device provides its maximum output current.

However, if the current limit situation remains for 512 consecutive switching cycles, the peak current folds back to about 1/3 of the regular limit. This limits the output power for over current and short circuit events. The foldback current limit is released to the normal one only if the load current has decreased as far as needed to undercut the (foldback) peak current limit.

## 8 Application and Implementation

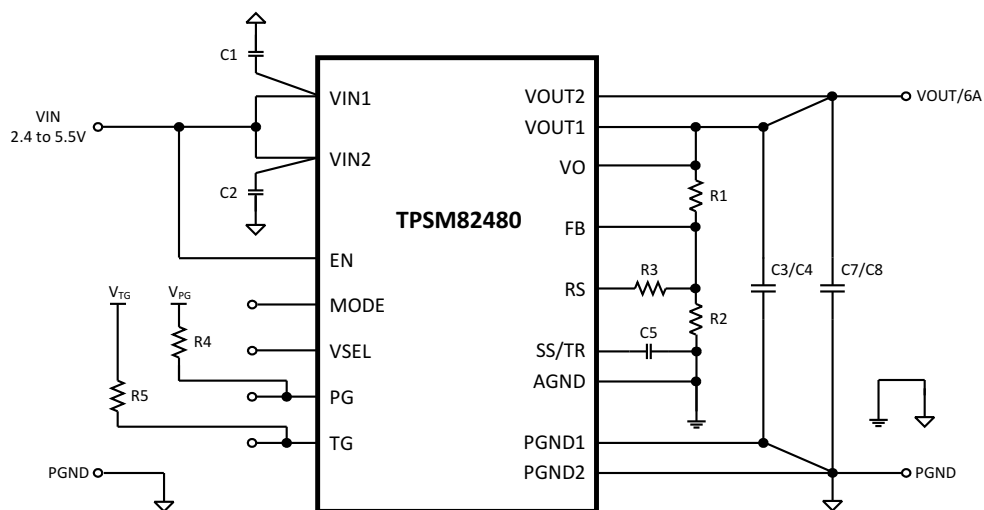

### 注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The TPSM82480 is a switched mode step-down converter module, able to convert a 2.4-V to 5.5-V input voltage into a lower 0.6-V to 5.5-V output voltage, providing up to 6 A continuous output current. It needs a minimum amount of external components. Apart from the output and input capacitors, additional resistors or capacitors are only needed to enable features like soft start, adjustable and selectable output voltage as well as Power Good and/or Thermal Good.

### 8.2 Typical Application

R4, R5	470-kΩ, chip, 0603, 1/16-W, 1%	Standard

### 8.2.2 Detailed Design Procedure

#### 8.2.2.1 Setting the Adjustable Output Voltage

While the device regulates the FB voltage to 0.6V, the output voltage is specified from 0.6 to 5.5 V. A resistive divider (from VOUT to FB to AGND) sets the actual output voltage of the TPSM82480. [公式 4](#) 和 [公式 5](#) 是计算电阻值的公式。首先，确定通过电阻分压器中的电流会导致总电阻 (R<sub>1</sub> + R<sub>2</sub>)。一个最小分压器电流约为 5 μA 是推荐的，并且可以根据需要更高。

$$R_1 + R_2 = \frac{V_{OUT}}{I_{FB}} \quad (4)$$

$$R_2 = \frac{V_{REF}}{V_{OUT}} (R_1 + R_2) \quad (5)$$

#### 8.2.2.2 Setting V<sub>OUT2</sub> Using the VSEL Feature

A V<sub>OUT</sub> level, different as set with R<sub>1</sub> and R<sub>2</sub> (see [Setting the Adjustable Output Voltage](#)), can be forced by connecting R<sub>3</sub> between FB and RS pins and pulling VSEL High. R<sub>3</sub> is calculated using [公式 6](#).

$$R_3 = \frac{V_1 \cdot R_1 \cdot R_2^2}{(V_2 - V_1) \cdot (R_1 \cdot R_2 + R_2^2)} \quad \text{for } (V_2 > V_1) \quad (6)$$

where:

V<sub>1</sub> is the lower level output voltage and

V<sub>2</sub> the higher level output voltage.

#### 8.2.2.3 Output Capacitor Selection

The recommended minimum output capacitance is 4 x 22 μF, that can be ceramic capacitors exclusively. A larger value of C<sub>OUT</sub> might be needed for V<sub>OUT</sub> ≤ 1.8V, to improve transient response performance, as well as for V<sub>OUT</sub> > 3.3 V to compensate for voltage bias effects of the ceramic capacitors. The usage of an additional feed forward capacitor can help reducing amount of output capacitance that is needed to achieve a certain transient response target (see [表 3](#)).

The TPSM82480 provides a wide output voltage range of 0.6 V to 5.5 V. While stability is a critical criteria for the output filter selection, the output capacitor value also determines transient response behavior, ripple and accuracy of V<sub>OUT</sub>. The internal compensation is designed for an output capacitance range from about 50 μF to 150 μF effectively. Since ceramic capacitors are used preferably, this translates into nominal values of 4 x 22 μF to 4 x 47 μF and mainly depends on the output voltage. The following values are recommended:

**表 2. Recommended Output Capacitor Values (nominal)**

	$V_{OUT} \leq 1.0V$	$1.0V \leq V_{OUT} \leq 3.3V$	$V_{OUT} \geq 3.3V$
2x22 $\mu$ F			
4x22 $\mu$ F		√	
4x47 $\mu$ F	√	√	√
6x47 $\mu$ F			

Beyond the recommendations in 表 2, other values can be chosen and might be suitable depending on  $V_{OUT}$  and actual effective capacitance. In such case, stability needs to be checked within the actual environment.

Even if the output capacitance is sufficient for stability, a different value might be desirable to improve the transient response behavior. 表 3 can be used to determine capacitor values for specific transient response targets:

**表 3. Recommended Output Capacitor Values (nominal)**

Output Voltage [V]	Load Step [A]	Output Capacitor Value <sup>(1)</sup>	Feedforward Capacitor <sup>(1)</sup>	Typical Transient Response Accuracy	
				$\pm$ mV	$\pm$ %
1.0	0 - 3	4 x 47 $\mu$ F	-	50	5
	3 - 6			50	5
1.8	0 - 3	4 x 22 $\mu$ F	36pF	50	3
	3 - 6			50	3
2.5	0 - 3	4 x 22 $\mu$ F	36pF	62	2.5
	3 - 6			50	2
3.3	0 - 3	4 x 47 $\mu$ F	36pF	100	3
	3 - 6			80	2.5

(1) The values in the table are nominal values. The effective capacitance can differ significantly, depending on package size, voltage rating and dielectric material.

The architecture of the TPSM82480 allows the use of tiny ceramic output capacitors with low equivalent series resistance (ESR). These capacitors provide low output voltage ripple and are recommended. To keep its low resistance up to high frequencies and to get narrow capacitance variation with temperature, it is recommended to use X5R or X7R dielectrics. Using even higher values than demanded for stability and transient response has further advantages like smaller voltage ripple and tighter dc output accuracy in Power Save Mode.

#### 8.2.2.4 Input Capacitor Selection

The input current of a buck converter is pulsating. Therefore, a low ESR input capacitor is required to prevent large voltage transients at the source but still providing peak currents to the device. The recommended Capacitance value for most applications is 2 x 10  $\mu$ F, split between the VIN1 and VIN2 inputs and placed as close as possible to these pins and PGND pins. If additional capacitance is needed, it can be added as bulk capacitance. To ensure proper operation, the effective capacitance at the VIN pins must not fall below 2 x 5  $\mu$ F.

Low ESR multilayer ceramic capacitors are recommended for best filtering. Increasing with input voltage, the dc bias effect reduces the nominal capacitance value significantly. To decrease input ripple current further, larger values of input capacitors can be used.

#### 8.2.2.5 Soft Start Capacitor Selection

The soft start ramp time can be set externally connecting a capacitor between the SS/TR and AGND pins. The capacitor value  $C_{SS}$  that is needed to get a specific rising time  $\Delta t_{SS}$  calculates as:

$$C_{SS} = \Delta t_{SS} \cdot \frac{5.25\mu A}{0.6V} \quad (7)$$

Since the device has an internal delay time  $\Delta t_{\text{DELAY}}$  from EN=High to start switching, the overall startup time is longer as shown in 图 8.

图 8. Soft Start  $\Delta t_{\text{SS}}$

If very large output capacitances are used (e.g.  $>4 \times 47 \mu\text{F}$ ), the use of a soft start capacitor is mandatory to avoid current limit foldback during startup (see [Current Limit and Short Circuit Protection](#)).

### 8.2.2.6 Tracking

For values up to 0.6V, an external voltage, connected to the SS/TR pin, drives the voltage level at the FB pin. In doing so, the voltage at the FB pin is directly proportional to the voltage at the SS/TR pin.

When choosing the resistive divider proportion according to 公式 8,  $V_{\text{OUT}}$  tracks  $V_{\text{TR}}$  simultaneously.

$$\frac{R_1}{R_2} = \frac{R_3}{R_4} \tag{8}$$

Copyright © 2017, Texas Instruments Incorporated

图 9. Voltage Tracking

Following the example of [Setting the Adjustable Output Voltage](#) with  $V_{OUT} = 1.8\text{ V}$ ,  $R_1 = 240\text{ k}\Omega$  and  $R_2 = 120\text{ k}\Omega$ , [公式 9](#) and [公式 10](#) calculate  $R_3$  and  $R_4$ , connected to the SS/TR pin. Different to the resistive divider at the FB pin, a larger current must be chosen, to avoid a tracking offset caused by the  $5.25\text{ }\mu\text{A}$  current that flows out of the SS/TR pin. Assuming a  $250\text{ }\mu\text{A}$  current,  $R_4$  calculates as follows:

$$R_4 = \frac{0.6\text{V}}{250\mu\text{A}} = 2.4\text{k}\Omega \quad (9)$$

$R_3$  calculates now rearranging [公式 8](#):

$$R_3 = R_4 \cdot \frac{R_1}{R_2} = 2.4\text{k}\Omega \cdot \frac{240\text{k}\Omega}{120\text{k}\Omega} = 4.8\text{k}\Omega \quad (10)$$

However, the following limitations can influence the tracking accuracy:

- The upper limit of the SS/TR voltage that can be tracked is about 0.6V. Since it is detected internally by a comparator, process variation and ramp speed can cause up to  $\pm 30\text{ mV}$  different threshold.
- In case that the voltage at SS/TR ramps up immediately when  $V_{IN}$  is supplied or EN is set High, the internal startup delay,  $\Delta t_{DELAY}$ , delays the ramp of  $V_{OUT}$ . The internal ramp starts after  $\Delta t_{DELAY}$  at the voltage level, which is actually present at the SS/TR pin.
- The tracking down speed is limited by the RC time constant of the internal output discharge (always connected when tracking down) and the actual load with the output capacitance. Note: The device tracks down with the same behavior for MODE High (Forced PWM) and Low (Auto PSM).

### 8.2.2.7 Thermal Good

The Thermal Good pin provides an open drain output. The logic level is given by the pull up source which can be  $V_{OUT}$ . In this case, TG goes or stays Low, when the device switches off due to EN, UVLO or Thermal Shutdown.

When using an independent source for the pull up logic, the logic behavior at shutdown differs, because the TG pin internally goes high impedance. As before, TG goes Low when TG threshold is reached, but goes back High in the event of being switched off (e.g. Thermal Shutdown).

### 8.2.3 Application Curves

$V_{IN} = 3.6\text{ V}$ ,  $V_{OUT} = 1.8\text{ V}$  ( $R1 / R2 = 240\text{ k}\Omega / 120\text{ k}\Omega$ ),  $T_A = 25^\circ\text{C}$ , (unless otherwise noted)

表 4. Resistive Divider Values for different Combinations of  $V_{OUT}$

OUTPUT VOLTAGE	R1	R2	R3
2.5V and 3.3V	380k $\Omega$	120k $\Omega$	285k $\Omega$
1.2V and 1.8V	120k $\Omega$	120k $\Omega$	120k $\Omega$
0.9V and 1.0V	60k $\Omega$	120k $\Omega$	360k $\Omega$

## 9 Power Supply Recommendations

The TPSM82480 is designed to operate from a 2.4-V to 5.5-V input voltage supply. The input power supply's output current needs to be rated according to the output voltage and the output current of the power rail application.

## 10 Layout

### 10.1 Layout Guidelines

A recommended PCB layout for the TPSM82480 dual phase solution is shown below. It ensures best electrical and optimized thermal performance considering the following important topics:

- Both  $V_{OUT1}$  and  $V_{OUT2}$  must be connected to build a common VOUT structure.
- The input capacitors must be placed as close as possible to the appropriate pins of the device. This provides low resistive and inductive paths for the high di/dt input current. The input capacitance is split, as is the  $V_{IN}$  connection, to avoid interference between the input lines.
- The  $V_{OUT}$  regulation loop is closed with  $C_{OUT}$  and its ground connection. To avoid PGND noise crosstalk, PGND is kept split for the regulation loop. If a ground layer or plane is used, a direct connection by vias, as shown, is recommended. Otherwise the connection of  $C_{OUT}$  to GND must be short for good load regulation.
- The FB node is sensitive to dv/dt signals. Therefore the resistive divider should be placed close to the FB (and  $R_S$  pin in case of using  $R_3$ ) pin, avoiding long trace distance.

For more detailed information about the actual EVM solution, see [SLVUA16](#).

## 12 机械、封装和可订购信息

以下页面包含机械、封装和可订购信息。这些信息是指定器件的最新可用数据。数据如有变更，恕不另行通知，也不会对此文档进行修订。如欲获取此数据表的浏览器版本，请参阅左侧的导航。

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPSM82480MOPR	ACTIVE	QFM	MOP	24	3000	RoHS & Green	Call TI	Level-2-260C-1 YEAR	-40 to 125	82480	<a href="#">Samples</a>
TPSM82480MOPT	ACTIVE	QFM	MOP	24	250	RoHS & Green	Call TI	Level-2-260C-1 YEAR	-40 to 125	82480	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided.
