

# SNx5DPHY440SS CSI-2/DSI DPHY 重计时器

## 1 特性

- 符合 MIPI DPHY 1.1 规范
- 实现低成本电缆解决方案
- 在 1.5Gbps 速率时最多支持 4 条通道
  - CSI-2/DSI 时钟频率范围为 100MHz 至 750MHz
- 关断状态下的功耗低于 mW
- 支持 MIPI DSI 双向 LP 模式
- 支持 ULPS 和 LP 功耗状态
- 可调输出电压摆幅
- 可选 TX 预加重电平
- 可调 Rx EQ 以补偿 ISI 损耗
- 可配置边沿速率控制
- 动态数据和时钟偏移补偿
- 具有 3kV ESD HBM 保护功能
- 工业温度范围: -40°C 至 85°C (SN65DPHY440SS)
- 商业级温度范围: 0°C 至 70°C (SN75DPHY440SS)
- 由 1.8V 单电源供电

## 2 应用

- 笔记本电脑
- 翻盖结构
- 平板电脑
- 摄像机

## 3 说明

DPHY440 是一款 1 至 4 通道时钟 MIPI DPHY 重定时器，用于重新生成 DPHY 信号。该器件符合 MIPI DPHY 1.1 标准，可在高达 1.5Gbps 的数据速率下应用于 MIPI CSI-2 或 MIPI DSI 应用。

该器件会补偿 PCB、连接器和电缆相关频率损耗和开关相关损耗，以在 CSI2/DSI 源设备和接收设备之间提供最佳 DP 电气性能。DPHY440 的 DPHY 输入端具有可配置的均衡器。

输出引脚会自动补偿在器件输入端口上接收的时钟和数据间的不一致偏移。DPHY440 输出电压摆幅和边沿速率可分别通过更改 VSADJ\_CFG0 引脚和 ERC 引脚的状态进行调节。

DPHY440 针对移动应用进行了优化，并且在 DPHY 链路接口上装有活动检测电路，以便在检测到 ULPS 和 LP 状态时切换到低功耗模式。

SN65DPHY440SS 在 -40°C 至 85°C 的工业级温度范围内额定运行，而 SN75DPHY440SS 在 0°C 至 70°C 的商业级温度范围内额定运行。

### 器件信息 (1)

器件型号	封装	封装尺寸 (标称值)
SN65DPHY440SS	WQFN (28)	3.50mm x 5.50mm
SN75DPHY440SS		

(1) 要了解所有可用封装，请参阅数据表末尾的可订购产品附录。

## 4 修订历史记录

### Changes from Revision B (August 2017) to Revision C Page

- Changed  $F_{(BR)}$  MAX value From: 1 Gbps To: 1.5 Gbps in the *Switching Characteristics* table ..... 9

### Changes from Revision A (April 2016) to Revision B Page

- 将特性从“CSI-2/DSI 时钟频率范围为 100MHz 至 500MHz”更改为“CSI-2/DSI 时钟频率范围为 100MHz 至 750MHz” ..... 1
- 更改了说明部分的文本，将“高达 1Gbps 的数据速率下的 MIPI DSI 应用。”更改为“高达 1.5Gbps 的数据速率下的 MIPI DSI 应用。” ..... 1
- Changed  $V_{IH} = 4$  dB To:  $V_{IH} = 5$  dB in the *Pin Functions* table ..... 4
- Added a Test Condition of EQ is at 750 MHz to  $V_{(RXEQ1)}$  in the *Electrical Characteristics* table ..... 7
- Changed  $V_{(RXEQ2)}$  TYP value From: 4 dB To: 5 dB in the *Electrical Characteristics* table ..... 7
- Changed the MIPI DPHY HS Interface section in the Timing Requirements table ..... 8
- Changed  $F_{(HSCLK)}$  From 500  $\mu$ sMHz To: 750 MHz in the *Switching Characteristics* table ..... 9
- Changed  $F_{(DESKEW)}$  from 500 MHz To: 750 MHz. .... 9
- Changed  $t_R$  and  $t_F$  Datarate Test Conditions and values ..... 9
- Changed text From: application at datarates of up to 1 Gbps To: application at datarates of up to 1.5 Gbps in the *Overview* section ..... 11
- Changed [Table 1](#) ..... 12
- Changed 11 – 4 dB To: 11 – 5 dB for RXEQ\_CLK in [Table 8](#) ..... 17
- Changed 11 – 4 dB To: 11 – 5 dB for RXEQ\_DATA in [Table 8](#) ..... 17
- Changed From: Data Rate To: Data Rate (200 Mbps to 1.5 Gbps) in [Table 15](#)..... 22

**Changes from Original (March 2016) to Revision A**
**Page**

• 将特性从“具有 3kV ESD HBM 保护功能”更改为“具有 2kV ESD HBM 保护功能” .....	1
• Changed From: (approx. 100K) To: (100K) in the <i>Pin Functions</i> table for pins 13 and 14.....	4
• Changed From: (approx. 100K) To: (100K) in the <i>Pin Functions</i> table for pins 26, 27, and 28.....	5
• Changed <i>ESD Ratings</i> values. HBM From: $\pm 2000$ To: $\pm 3000$ , and CDM Form: $\pm 500$ To: $\pm 1000$ .....	6
• Changed $V_{(RXEQ2)}$ TYP value From: 5 dB To: 4 dB in the <i>Electrical Characteristics</i> table .....	7
• Added MIN and MAX values to $ V_{OD(VD0)} $ , $ V_{OD(VD1)} $ , and $ V_{OD(VD2)} $ in the <i>Electrical Characteristics</i> table .....	7
• Deleted rows $Z_{OS}$ and $\Delta Z_{OS}$ from the <i>Electrical Characteristics</i> table .....	8
• Updated the MIPI DPHY LP Transmitter Interface section of the <i>Switching Characteristics</i> table.....	9
• Changed 5 dB to 4 dB in <i>HS Receive Equalization</i> and <a href="#">Table 1</a> .....	12
• Changed 11 – 4 dB To: 11 – 5 dB in <a href="#">Table 8</a> .....	17

## 5 Pin Configuration and Functions

**RHR Package  
28 Pin (WQFN)  
Top View**

**Pin Functions**

PIN		I/O	INTERNAL PULLUP/PULLDOWN	DESCRIPTION
NAME	NO.			
DA0P	1	100-Ω Differential Input		CSI-2/DSI Lane 0 Differential positive Input. Supports DSI LP Backchannel. If unused, this pin should be tied to GND.
DA0N	2			CSI-2/DSI Lane 0 Differential negative Input. Supports DSI LP Backchannel. If unused, this pin should be tied to GND.
DA1P	3	100-Ω Differential Input (Failsafe)		CSI-2/DSI Lane 1 Differential positive Input. If unused, this pin should be tied to GND.
DA1N	4			CSI-2/DSI Lane 1 Differential negative input. If unused, this pin should be tied to GND.
DACP	5	100-Ω Differential Input (Failsafe)		CSI-2/DSI Differential Clock positive Input
DACN	6			CSI-2/DSI Differential Clock negative Input
DA2P	7	100-Ω Differential Input (Failsafe)		CSI-2/DSI Lane 2 Differential positive Input. If unused, this pin should be tied to GND.
DA2N	8			CSI-2/DSI Lane 2 Differential negative Input. If unused, this pin should be tied to GND.
DA3P	9	100-Ω Differential Input (Failsafe)		CSI-2/DSI Lane 3 Differential positive Input. If unused, this pin should be tied to GND.
DA3N	10			CSI-2/DSI Lane 3 Differential negative Input. If unused, this pin should be tied to GND.
VCC	11	Power		1.8V (±10%) Supply.
VREG_OUT	12	Power		1.2 V Regulator Output. Requires a 0.1 μF capacitor to GND.
EQ/SCL	13	I/O (3-level)	PU (100K) PD (100K)	RX Equalization Select. Pin state sampled on rising edge of RSTN. This pin also functions as I2C SCL pin. $V_{IL} = 0$ dB $V_{IM} = 2.5$ dB $V_{IH} = 5$ dB
ERC/SDA	14	I/O (3-level)	PU (100K) PD (100K)	Edge Rate Control for DB[4:0]P/N High speed transmitter rise and fall time. Pin state sampled on rising edge of RSTN. This pin also functions as I2C SDA pin. $V_{IL} = 200$ ps typical $V_{IM} = 150$ ps typical $V_{IH} = 250$ ps typical

**Pin Functions (continued)**

PIN		I/O	INTERNAL PULLUP/PULLDOWN	DESCRIPTION
NAME	NO.			
DB3N	15	100-Ω Differential Output		CSI-2/DSI Lane 3 Differential negative Output. If unused, this pin should be left unconnected.
DB3P	16		CSI-2/DSI Lane 3 Differential positive Output. If unused, this pin should be left unconnected.	
DB2N	17	100-Ω Differential Output		CSI-2/DSI Lane 2 Differential negative Output. If unused, this pin should be left unconnected.
DB2P	18		CSI-2/DSI Lane 2 Differential positive Output. If unused, this pin should be left unconnected.	
DBCN	19	100-Ω Differential Output		CSI-2/DSI Differential Clock negative Output
DBCP	20		CSI-2/DSI Differential Clock positive Output	
DB1N	21	100-Ω Differential Output		CSI-2/DSI Lane 1 Differential negative Output. If unused, this pin should be left unconnected.
DB1P	22		CSI-2/DSI Lane 1 Differential positive Output. If unused, this pin should be left unconnected.	
DB0N	23	100-Ω Differential Output		CSI-2/DSI Lane 0 Differential negative Output. Supports DSI LP Back channel. If unused, this pin should be left unconnected.
DB0P	24		CSI-2/DSI Lane 0 Differential positive Output. Supports DSI LP Back channel. If unused, this pin should be left unconnected.	
VDD	25	Power		This pin must be connected to the VREG_OUT pin through at least a 10-mil trace and a 0.1 μF capacitor to ground.
PRE_CFG1	26	I/O (3-level)	PU (100K) PD (100K)	Controls DPHY TX HS pre-emphasis level and the LP TX rise and fall times. Pin state is sampled on the rising edge of RSTN. $V_{IL} = 0$ dB $V_{IM} = 0$ dB $V_{IH} = 2.5$ dB
VSADJ_CFG0	27	I (3-level)	PU (100K) PD (100K)	Controls output voltage swing for DB HS transmitters and the LP TX rise and fall times. Pin state is sampled on the rising edge of RSTN. Refer to <a href="#">Table 3</a> for details on voltage swing settings based on this pin and PRE_CFG1 sampled state. $V_{IL} = 200$ mV or 220 mV based on PRE_CFG1 sampled state. $V_{IM} = 200$ mV typical $V_{IH} = 220$ mV typical
RSTN	28	I	PU (300K)	Reset, active low. When low, all internal CSR are reset to default and DPHY440 is placed in low power state.
GND	Thermal pad	GND		Ground.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) <sup>(1)</sup>

		MIN	MAX	UNIT
Supply voltage range	V <sub>CC</sub>	-0.3	2.175	V
Voltage range	DPHY Lane I/O Differential Voltage	-0.3	1.4	V
	RSTN	-0.3	2.175	V
	All other terminals	-0.3	2.175	V
Maximum junction temperature, T <sub>J</sub>			105	°C
Storage temperature, T <sub>stg</sub>		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±3000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V <sub>CC</sub>	Supply voltage	1.62	1.8	1.98	V
T <sub>A</sub>	Operating free-air temperature [SN65DPHY440SS]	-40		85	°C
	Operating free-air temperature [SN75DPHY440SS]	0		70	

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		SNx5DPHY440SS	UNIT
		RHR (WQFN)	
		12 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	42.1	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	32.3	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	12.8	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.5	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	12.6	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	5.2	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

## 6.5 Electrical Characteristics, Power Supply

over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
PACTIVE1_SS	Power under normal operation for 4 data lanes + clock.	DPHY Lanes at 1 Gbps; V <sub>CC</sub> supply stable, V <sub>CC</sub> = 1.8 V;		150		mW
PACTIVE2_SS	Power under normal operation for 2 data lanes + clock.	DPHY Lanes 1 Gbps; V <sub>CC</sub> supply stable, V <sub>CC</sub> = 1.8 V;		115		mW
PLP11_SS	LP11 Power	All DPHY lanes in LP11; V <sub>CC</sub> supply stable; V <sub>CC</sub> = 1.8 V;		14		mW
PRSTN_SS	RSTN Power	RSTN held in asserted state (low); V <sub>CC</sub> supply stable; V <sub>CC</sub> = 1.8 V;		0.75		mW

## 6.6 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>Standard IO (RSTN, ERC, EQ, CFG[1:0])</b>						
V <sub>IL</sub>	Low-level control signal input voltage				0.2 x V <sub>CC</sub>	V
V <sub>IM</sub>	Mid-level control signal input voltage			V <sub>CC</sub> / 2		V
V <sub>IH</sub>	High-level control signal input voltage		0.8 x V <sub>CC</sub>			V
V <sub>F</sub>	Floating Voltage	V <sub>IN</sub> = High Impedance		V <sub>CC</sub> / 2		V
V <sub>OL</sub>	Low level output voltage (open-drain). ERC (SDA) only	At I <sub>OL</sub> max.			0.2 x V <sub>CC</sub>	V
I <sub>OL</sub>	Low Level Output Current				3	mA
I <sub>IH</sub>	High level input current				±36	µA
I <sub>IL</sub>	Low level input current				±36	µA
R <sub>PU</sub>	Internal pull-up resistance			100		kΩ
R <sub>PD</sub>	Internal pull-down resistance			100		kΩ
R <sub>(RSTN)</sub>	RSTN control input pullup resistor			300		kΩ
<b>MIPI Input Leakage (DA1P/N, DA2P/N, DA3P/N, DACP/N)</b>						
I <sub>ikg</sub>	Input failsafe leakage current	V <sub>CC</sub> = 0 V; V <sub>DD</sub> = 0 V; MIPI DPHY pulled up to 1.35 V	-65		65	µAV
<b>MIPI DPHY HS RECIEVER INTERFACE (DA0P/N, DA1P/N, DA2P/N, DA3P/N, DACP/N)</b>						
V <sub>(CM-RX_DC)</sub>	Differential Input Common-mode voltage HS Receive mode	V <sub>(CM-RX)</sub> = (V <sub>A x P</sub> + V <sub>A x N</sub> )/2	70		330	mV
V <sub>ID</sub>	HS Receiver input differential voltage	V <sub>ID</sub>   =  V <sub>A x P</sub> - V <sub>A x N</sub>	70			mV
V <sub>IH(HS)</sub>	Single-ended input high voltage				460	mV
V <sub>IL(HS)</sub>	Single-ended input low voltage		-40			mV
R <sub>(DIFF-HS)</sub>	Differential input impedance		80	100	125	Ω
V <sub>(RXEQ0)</sub>	Rx EQ gain when EQ/SCL pin ≤ V <sub>IL</sub>			0		dB
V <sub>(RXEQ1)</sub>	Rx EQ gain when EQ/SCL pin = V <sub>IM</sub>	At 750 MHz		2.5		dB
V <sub>(RXEQ2)</sub>	Rx EQ gain when EQ/SCL pin ≥ V <sub>IH</sub>	At 750 MHz		5		dB
<b>MIPI DPHY LP Receiver Interface (DA0P/N, DA1P/N, DA2P/N, DA3P/N, DACP/N, DB0P/N)</b>						
V <sub>(LPIH)</sub>	LP Logic 1 Input Voltage		880			mV
V <sub>(LPIL)</sub>	LP Logic 0 Input voltage				550	mV
V <sub>(HYST)</sub>	LP Input Hysteresis		25			mV
<b>MIPI DPHY HS Transmitter Interface (DB0P/N, DB1P/N, DB2P/N, DB3P/N, DBCP/N)</b>						
V <sub>(CMTX)</sub>	HS Transmit static common-mode voltage	V <sub>(CMTX)</sub> = (V <sub>(BP)</sub> + V <sub>(BN)</sub> ) / 2	150	200	300	mV
ΔV <sub>(CMTX) (1,0) </sub>	VCMTX mismatch when output is Differential-1 or differential-0.	ΔV <sub>(CMTX) (1,0)</sub> = (V <sub>(CMTX) (1)</sub> - V <sub>(CMTX) (0)</sub> ) / 2			5	mV
V <sub>OD(VD0)</sub>	HS Transmit differential voltage for CFG0 = 2'b00 with TX pre-emphasis disabled or for non-transition bit when TX pre-emphasis is enabled.	V <sub>OD</sub>   =  V <sub>(DP)</sub> - V <sub>(DN)</sub>	140	180	220	mV
V <sub>OD(VD1)</sub>	HS Transmit differential voltage for CFG0 = V <sub>IM</sub> with TX pre-emphasis disabled or for non-transition bit when TX pre-emphasis is enabled.	V <sub>OD</sub>   =  V <sub>(DP)</sub> - V <sub>(DN)</sub>   CFG0 = V <sub>IM</sub>	160	200	250	mV

## Electrical Characteristics (continued)

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$ V_{OD(VD2)} $	HS Transmit differential voltage for CFG0 = $V_{IH}$ with TX pre-emphasis disabled or for non-transition bit when pre-emphasis is enabled..	$ V_{OD}  =  V_{(DP)} - V_{(DN)} $ CFG0 $\geq V_{IH}$	170	220	270	mV
$ \Delta V_{OD} $	$V_{OD}$ mismatch when output is differential-1 or differential-0.	$\Delta V_{OD} =  \Delta V_{O(D1)}  -  \Delta V_{O(D0)} $			14	mV
$V_{OH(HS)}$	HS Output high voltage for non-transition bit.	CFG0 $\geq V_{IH}$ HS Pre = 2.5 dB			430	mV
$V_{(PRE1)}$	Pre-emphasis Level for HSTX_PRE = 2'b00.. Refer to <a href="#">Figure 3</a>	PRE = 20 x LOG ( $V_{OD(TBx)} / V_{OD(VDx)}$ )		1.5		dB
$V_{(PRE2)}$	Pre-emphasis level for HSTX_PRE = 2'b1X. Refer to <a href="#">Figure 3</a>	PRE = 20 x LOG ( $V_{OD(TBx)} / V_{OD(VDx)}$ )		2.5		dB
<b>MIPI DPHY LP Transmitter Interface (DB0P/N, DB1P/N, DB2P/N, DB3P/N, DBCP/N, DA0P/N)</b>						
$V_{(LPOH)}$	LP Output High Level		1.1	1.2	1.3	V
$V_{(LPOL)}$	LP Output Low Level		-50		50	mV
$V_{IH(CD)}$	LP Logic 1 contention threshold		450			mV
$V_{IL(CD)}$	LP Logic 0 contention threshold				200	mV
$Z_{O(LP)}$	Output Impedance of LP transmitter		110			$\Omega$

## 6.7 Timing Requirements

		MIN	NOM	MAX	UNIT
<b>I2C (ERC (SDA), EQ (SCL))</b>					
$t_{HD,STA}$	Hold Time (repeated) START condition. After this period, the first clock pulse is generated	4			$\mu$ s
$t_{LOW}$	Low period of SCL clock	4.7			$\mu$ s
$t_{HIGH}$	High period of SCL clock	4			$\mu$ s
$t_{SU,STA}$	Setup time for a repeated START condition	4.7			$\mu$ s
$t_{HD,DAT}$	Data hold time	5			$\mu$ s
$t_{SU,DAT}$	Data setup time	4			$\mu$ s
$t_{SU,STO}$	Setup time for STOP condition	4			$\mu$ s
$t_{BUF}$	Bus free time between a STOP and START condition	4.7			$\mu$ s
<b>MIPI DPHY HS Interface</b>					
$t_{HSPD}$	Propagation delay from DA to DB.		4 + 12ns	4 + 40ns	UI
$t_{DBC\_DCYCLE}$	DAC to DBC output duty cycle distortion percentage	750 MHz clock with 50%-50% duty cycle at DAC input.	-5	5	%
$t_{SKEW-TX-1G}$	Data to Clock variation from 0.5UI. Refer to <a href="#">Figure 2</a>	Datarate $\leq$ 1 Gbps	-0.1	0.1	UI
$t_{SETUP-RX-1G}$	Data to Clock setup time. Refer to <a href="#">Figure 2</a>	Datarate $\leq$ 1 Gbps	0.1		UI
$t_{HOLD-RX-1G}$	Clock to data hold time. Refer to <a href="#">Figure 2</a>	Datarate $\leq$ 1 Gbps	0.1		UI
$t_{SKEW-TX-1P5G}$	Data to Clock variation from 0.5UI. Refer to <a href="#">Figure 2</a>	Datarate > 1 Gbps	-0.15	0.15	UI
$t_{SETUP-RX-1P5G}$	Data to Clock setup time. Refer to <a href="#">Figure 2</a>	Datarate > 1 Gbps	0.15		UI
$t_{HOLD-RX-1P5G}$	Clock to data hold time. Refer to <a href="#">Figure 2</a>	Datarate > 1 Gbps	0.15		UI

## 6.8 Switching Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP <sup>(1)</sup>	MAX	UNIT
<b>I2C (ERC (SDA), EQ (SCL))</b>					
$F_{(SCL)}$	I2C Clock Frequency			100	kHz
$t_{F\_I2C}$	Fall time of both SDA and SCL signals	Load of 350 pF with 2-K pullup resistor.		300	ns
$t_{R\_I2C}$	Rise Time of both SDA and SCL signals	Measure at 30% - 70%		1000	ns
<b>DPHY LINK</b>					
$F_{(BR)}$	Bit Rate			1.5	Gbps
$F_{(HSCLK)}$	HS Clock Input range	100		750	MHz
$F_{(DESKEW)}$	Automatic Deskew range	220		750	MHz
<b>MIPI DPHY HS Receiver Interface (DA0P/N, DA1P/N, DA2P/N, DA3P/N, DACP/N)</b>					
$\Delta V_{(CMRX\_HF)}$	Common-mode Interface beyond 450 MHz			100	mV
$\Delta V_{(CMRX\_LF)}$	Common-mode interference 50 MHz – 450 MHz	-50		50	mV
<b>MIPI DPHY HS Transmitter Interface (DB0P/N, DB1P/N, DB2P/N, DB3P/N, DBCP/N)</b>					
$\Delta V_{(CMRX\_HF)}$	Common-level variations above 450 MHz			5	mVrms
$\Delta V_{(CMRX\_LF)}$	Common-level variation between 50 MHz – 450 MHz.			25	mVpeak
$t_R$ and $t_F$	20% - 80% rise time and fall time	Datarate $\leq$ 1 Gbps		0.3	UI
		Datarate $>$ 1 Gbps		0.35	UI
		100			ps
<b>MIPI DPHY LP Receiver Interface (DA0P/N, DA1P/N, DA2P/N, DA3P/N, DACP/N, DB0P/N)</b>					
$e_{SPIKE}$	Input Pulse rejection			300	V ps
$t_{MIN(RX)}$	Minimum pulse width response	20			ns
$V_{(INT)}$	Peak interference amplitude			200	mv
$F_{(INT)}$	Interference Frequency	450			Mhz
$t_{(LP-PULSE-RX)}$	Pulse Width of the XOR of DAxP and DAxN	First LP XOR clock pulse after Stop state or last pulse before Stop state.	42		ns
		All other pulses.	22		ns
<b>MIPI DPHY LP Transmitter Interface (DB0P/N, DB1P/N, DB2P/N, DB3P/N, DBCP/N, DA0P/N)</b>					
$t_{REOT}$	30% - 85% rise time and fall time	Measured at end of HS transmission.		35	ns
$t_{(LP-PULSE-TX)}$	Pulse Width of the LP XOR clock	First LP XOR clock pulse after Stop state or last pulse before Stop state	40		ns
		All other pulses	20		ns
$t_{(LP-PER-TX)}$	Period of the LP XOR clock	90			ns
$\delta V/\delta t_{sr}$	Slew Rate at $C_{LOAD} = 70$ pF			150	mV/ns
	Slew Rate at $C_{LOAD} = 0$ pF Falling edge only	30			mV/ns
	Slew Rate at $C_{LOAD} = 0$ pF Rising edge only	30			mV/ns
$C_{LOAD}$	Load Capacitance			70	pF

(1) (1) All typical values are at  $V_{CC} = 3.3$  V, and  $T_A = 25^\circ\text{C}$ .

## 7 Detailed Description

### 7.1 Overview

The DPHY440SS is a one to four lane and clock MIPI DPHY re-driver that regenerates the DPHY signaling. The device complies with MIPI DPHY 1.1 standard and can be used in either a MIPI CSI-2 or MIPI DSI application at data rates of up to 1.5 Gbps.

The device compensates for PCB, connector, and cable related frequency loss and switching related loss to provide the optimum electrical performance from a CSI2/DSI source to sink. The DPHY440 DPHY inputs feature configurable equalizers.

The output pins will automatically compensate for uneven skew between clock and data lanes. The DPHY440 output swing and edge rate can be adjusted by changing the state of the VSADJ\_CFG0 pin and ERC pin respectively.

The DPHY440 is optimized for mobile applications, and contains activity detection circuitry on the DPHY Link interface that can transition into a lower power mode when in ULPS and LP states.

The device is characterized for an extended operational temperature range from  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ .

## 7.3 Feature Description

### 7.3.1 HS Receive Equalization

The DPHY440 supports three levels of receive equalization to compensate for ISI loss in the channel. These three levels are 0 dB, 2.5 dB, and 5 dB at 750MHz. The equalization level used by the DPHY440 is determined by the state of the EQ/SCL pin at the rising edge of RSTN. If necessary, the receiver equalization level can also be set through writing to the RXEQ register via the local I2C interface

**Table 1. EQ/SCL pin Function**

EQ/SCL PIN	HS Rx EQUALIZATION
$\leq V_{IL}$	0 dB
$V_{IM}$	2.1 dB at 500 MHz / 2.5 dB at 750 MHz
$\geq V_{IH}$	4 dB at 500 MHz / 5 dB at 750 MHz

### 7.3.2 HS TX Edge Rate Control

The DPHY440 supports control of the rise and fall time for the DB[3:0]P/N and DBCP/N High Speed (HS) transmitters. Depending on system operating datarate, the HS edge rate may need to be adjusted to help improve EMI performance. The HS edge rate setting is determined through the sampled state of ERC/SDA pin at the rising edge of RSTN. If necessary, the HS edge rate can be adjusted by writing to the HS\_ERC register via the local I2C interface.

**Table 2. 8.3.2 HS TX Edge Rate Control**

ERC/SDA PIN	HS RISE/FALL TIMES
$\leq V_{IL}$	200 ps typical
$V_{IM}$	150 ps typical
$\geq V_{IH}$	250 ps typical

The DPHY440 also supports edge rate control for the LP interface. The adjustment of LP TX edge rate is determined by the state of the VSADJ\_CFG0 and PRE\_CFG1 pins as depicted in [Table 3](#), but can also be modified by changing LP\_ERC register through the local I2C interface

### 7.3.3 TX Voltage Swing and Pre-Emphasis Control

In some applications, the DPHY440 may be placed at a location in the system where the channel from DPHY440 DB[3:0]P/N interface to the DPHY Sink (CSI-2 or DSI) is extremely long and the DPHY Sink does not have enough receive equalization to compensate for the ISI loss. In this application, the system architect may want to use the DPHY440 TX pre-emphasis feature to compensate for the lack of equalization at the DPHY sink. The DPHY440 provides two levels of pre-emphasis: 0 dB, and 2.5 dB. The TX Pre-emphasis settings is determined through the sampled state of PRE\_CFG[1:0] pins at the rising edge of RSTN. If necessary, the TX Pre-emphasis settings can be adjusted by writing to the HSTX\_PRE register through the local I2C interface.

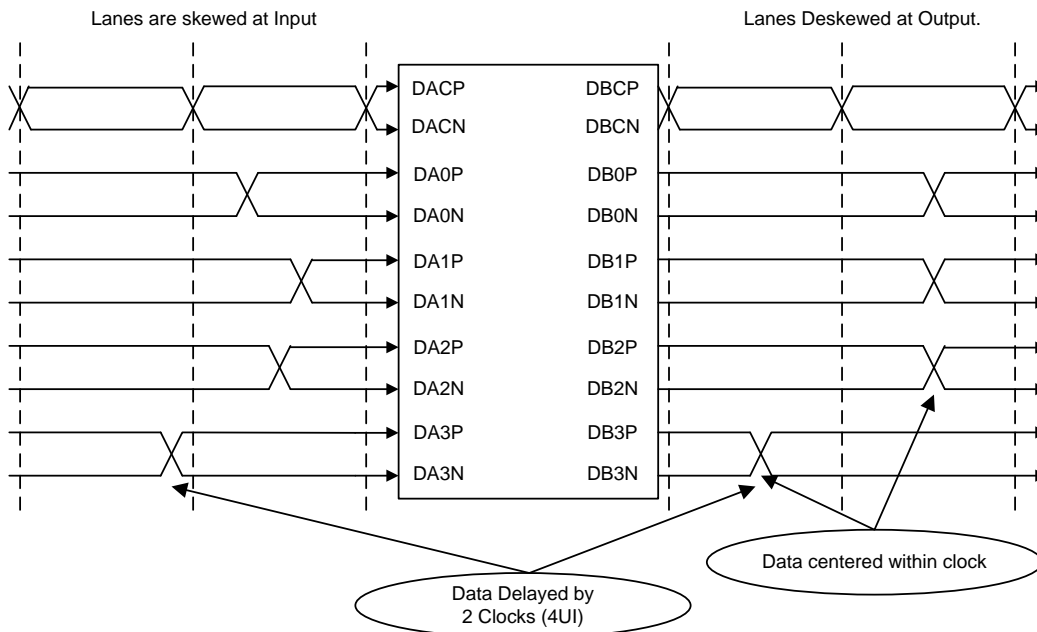

This feature must only be used when the HS pre-emphasis bit (transition bit) is attenuated by the channel. Enabling pre-emphasis in a system that has little channel loss (transition bit is not attenuated) may result in negative impact to system performance.

**Table 3. HS Voltage Swing, HS Pre-emphasis, LPTX Edge Rate Controls**

VSADJ_CFG0	PRE_CFG1	HS TX VOD	HS TX PRE-EMPHASIS	DB[3:0] LP TX RISE/FALL TIME
$\leq V_{IL}$	$\leq V_{IL}$	200 mV	0 dB	18 ns
$V_{IM}$	$\leq V_{IL}$	200 mV	0 dB	27 ns
$\geq V_{IH}$	$\leq V_{IL}$	220 mV	0 dB	18 ns
$\leq V_{IL}$	$V_{IM}$	200 mV	0 dB	27 ns
$V_{IM}$	$V_{IM}$	200 mV	0 dB	21 ns
$\geq V_{IH}$	$V_{IM}$	220 mV	0 dB	21 ns
$\leq V_{IL}$	$\geq V_{IH}$	220 mV	2.5 dB	27 ns
$V_{IM}$	$\geq V_{IH}$	200 mV	2.5 dB	21 ns
$\geq V_{IH}$	$\geq V_{IH}$	220 mV	2.5 dB	21 ns

### 7.3.4 Dynamic De-skew

The DPHY440 implements a dynamic de-skew feature which will continuously de-skew the HS data received on the DA[3:0]P/N interface and provide a retimed version on the DB[3:0]P/N interface. The retimed version is centered within the DBCP/N clock.

**Figure 6. Dynamic De-skew**

**NOTE**

The dynamic de-skew feature is only enabled in HS mode, and causes a 2 clock (4 UI) delay of data while data traverses from DA to DB.

## 7.4 Device Functional Modes

**Figure 7. Functional Modes**

### 7.4.1 Shutdown Mode

The DPHY440 can be placed into a low power consumption state by asserting the RSTN pin low while maintaining a stable  $V_{CC}$  and  $V_{DD}$  power supply. While in the Shutdown state, the DPHY440 drives DB[3:0]P/N and DBCP/N pins to the LP00 state. The DPHY440 ignores all activity on the DA[3:0]P/N and DACP/N pins while in Shutdown mode. The Shutdown mode is exited by de-asserting the RSTN pin high. Upon exiting Shutdown mode, the DPHY440 enters LP Mode operation and pass what is received on the DA interface to the DB interface.

### 7.4.2 LP Mode

In this mode, the DPHY440 passes LP signals between DA[3:0]P/N and DB[3:0]P/N. The internal terminations for the HS receiver and HS transmitter are disabled when operating in this mode.

The MIPI DSI specification defines bidirectional communication between the host and peripheral. When a response is needed by the peripheral, the response is returned using LP signaling from DB0P/N to DA0P/N. The DPHY440 only supports this communication over lane 0 (DB0P/N to DA0P/N). The remaining lanes cannot be used for LP communications from peripheral to host (reverse direction).

### 7.4.3 ULPS Mode

The DPHY440 is continuously monitoring the DPHY LP protocol for entry into the ULPS state. Upon entry into the ULPS state, the DPHY440 keeps active the logic necessary for LP signaling (LP rx, LPtx, LP state machine, so forth). All logic needed for HS operation are disabled. This allows for a lower power state than can be achieved when in operating other LP power states.

---

**NOTE**

ULPS mode can only be entered from LP Mode.

---

### 7.4.4 HS Mode

The HS mode is entered when the required sequence of LP signals is detected by the LP state machine. In this mode, the internal termination for both the HS receiver and HS transmitter is enabled and the dynamic de-skew feature is enabled. The DPHY440 remains in this mode until a HS exit is detected by the LP state machine. Upon detecting the HS exit, the DPHY440 immediately transitions to *LP Mode*.

## 7.5 Register Maps

The DPHY440 local I2C interface is enabled when RSTN is input high. Access to the CSR registers is supported during ultra-low power state (ULPS). The EQ/SCL and ERC/SDA terminals are used for I<sup>2</sup>C clock and I<sup>2</sup>C data respectively. The DPHY440 I2C interface conforms to the two-wire serial interface defined by the I<sup>2</sup>C Bus Specification, Version 2.1 (January 2000) and supports up to 100 kHz.

The device address byte is the first byte received following the START condition from the master device. The 7 bit device address for DPHY440 is factory preset to 1101100.

**Table 4. DPHY440 I<sup>2</sup>C Target Address Description**

Bit 7 (MSB)	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0 (W/R)
1	1	0	1	1	0	0	0/1
Address Cycle is 0xD8 (Write) and 0xD9 (Read)							

The following procedure should be followed to write to the DPHY440 I<sup>2</sup>C registers:

1. The master initiates a write operation by generating a start condition (S), followed by the DPHY440 7-bit address and a zero-value “W/R” bit to indicate a write cycle.
2. The DPHY440 acknowledges the address cycle.
3. The master presents the sub-address (I<sup>2</sup>C register within DPHY440) to be written, consisting of one byte of data, MSB-first
4. The DPHY440 acknowledges the sub-address cycle.
5. The master presents the first byte of data to be written to the I<sup>2</sup>C register.
6. The DPHY440 acknowledges the byte transfer.
7. The master may continue presenting additional bytes of data to be written, with each byte transfer completing with an acknowledge from the DPHY440.
8. The master terminates the write operation by generating a stop condition (P).

The following procedure should be followed to read the DPHY440 I<sup>2</sup>C registers:

1. The master initiates a read operation by generating a start condition (S), followed by the DPHY440 7-bit address and a one-value “W/R” bit to indicate a read cycle
2. The DPHY440 acknowledges the address cycle.
3. The DPHY440 transmit the contents of the memory registers MSB-first starting at register 00h or last read sub-address+1. If a write to the DPHY440 I<sup>2</sup>C register occurred prior to the read, then the DPHY440 starts at the sub-address specified in the write.
4. The DPHY440 will wait for either an acknowledge (ACK) or a not-acknowledge (NACK) from the master after each byte transfer; the I2C master acknowledges reception of each data byte transfer.
5. If an ACK is received, the DPHY440 transmits the next byte of data.
6. The master terminates the read operation by generating a stop condition (P).

The following procedure should be followed for setting a starting sub-address for I<sup>2</sup>C reads:

1. The master initiates a write operation by generating a start condition (S), followed by the DPHY440 7-bit address and a zero-value “W/R” bit to indicate a write cycle.
2. The DPHY440 acknowledges the address cycle.
3. The master presents the sub-address (I<sup>2</sup>C register within DPHY440) to be written, consisting of one byte of data, MSB-first.
4. The DPHY440 acknowledges the sub-address cycle.
5. The master terminates the write operation by generating a stop condition (P).

### NOTE

If no sub-addressing is included for the read procedure, and reads start at register offset 00h and continue byte by byte through the registers until the I2C master terminates the read operation. If a I<sup>2</sup>C write occurred prior to the read, then the reads start at the sub-address specified by the write.

### 7.5.1 BIT Access Tag Conventions

A table of bit descriptions is typically included for each register description that indicates the bit field name, field description, and the field access tags. The field access tags are described in [Table 5](#).

**Table 5. Tag Conventions**

ACCESS TAG	NAME	DEFINITION
R	Read	The field may be read by software.
W	Write	The field may be written by software
S	Set	The field may be set by a write of one. Writes of zero to the field have no effect.
C	Clear	The field may be cleared by a write of one. Write of zero to the field have no effect.
U	Update	Hardware may autonomously update this field
N/A	No Access	Not accessible or not applicable

Timer is reset to default state when BTA request is detected and is stopped when BTA is acknowledged. If BTA is not acknowledged before this timer expires, then DPHY440 will terminate BTA operation. This counter operates on the LPTX clock. Defaults to 0xFF.

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information,

The DPHY440 supports up to 4 DSI DPHY lanes and a clock lane. One of the four lanes is used for back channel communications between GPU and DSI panel. DPHY440's lane 0 is the only lane that supports the back channel. For this reason, DPHY440 lane 0 must always be connected to lane 0 of GPU and panel.

Other combinations, like 1 and 3 lane, examples are not shown, but are fully supported by the DPHY440. For all DSI implementations, the polarity must be maintained between the DSI Source and DSI Sink. The DPHY440 does not support polarity inversion.

### 8.2 Typical Application, CSI-2 Implementations

The DPHY440 supports 4 CSI-2 DPHY lanes plus a clock. Unlike DSI, CSI-2 does not have a back channel path. Because of this, there is no requirement on lane ordering. Because there is no lane ordering requirement, there are more combinations which can be implemented. All possible combinations are supported by the DPHY440. For all CSI-2 implementations, the polarity must be maintained between the CSI-2 Source and CSI-2 Sink. The DPHY440 does not support polarity inversion.

Figure 17. CSI-2 Example: Typical SNx5DPHY440SS Placement in the System

**Typical Application, CSI-2 Implementations (continued)**

**Figure 18. CSI-2 Two Lane Example**
**8.2.1 Design Requirements**

Typically, in CSI-2 applications, the system trace length from the Camera (Source) to the DPHY440 device is different from that of the trace length from DPHY440 to the APU (Sink). Consequently, different pre-emphasis and equalization settings are required on the receiver and transmitter side of the device respectively.

For this design example, refer to [Figure 17](#) and [Figure 18](#). Shown is a CSI-2 system implementation in which the DPHY device is placed close to the Sink (APU). Here, the input trace length is about 12 inch while the output trace length is just 1 inch. The input signal characteristics assumed are shown in [Table 15](#).

**Table 15. Design Parameters**

PARAMETER	VALUE
Data Rate (200 Mbps to 1.5 Gbps)	1 Gbps
Input trace length	12 inch
Output trace length	1 inch
Trace width	10 mils

## 8.2.2 Detailed Design Procedure

The typical example describes how to configure the VSADJ, PRE, EQ and ERC configuration pins of the DPHY440 device based on the board trace length between the Source (Camera) and DPHY440 and the DPHY440 and Sink (APU). Actual configuration settings might differ due to additional factors such as board layout, and connectors used in the signal path.

Though the data rate in this example is 1 Gbps, device is placed near to the Sink, with a short output trace of 1 inch. Consequently, the ERC pin can be configured to have a rise/fall time of 250 ps for the edge. Further, due to the short output trace, the PRE pin must be configured to a setting of 0 dB and the VSADJ to be 200 mV. The Application Curve in [Figure 22](#) shows the FR-4 loss characteristics of a 10 mil wide, 12 inch long trace. From this plot, the input signal trace suffers a loss of 1.5 dB at 500 MHz. Thus, the EQ setting can be either 0 dB or 2.5 dB. All the configuration settings and their corresponding inputs are tabulated in [Table 16](#).

**Table 16. Configuration Pin Settings**

PIN	SETTING	INPUT VALUE
VSADJ	200 mV	$V_{IM}$
PRE	0 dB	$V_{IM}$
EQ	0 dB or 2.5 dB	$V_{IL}$ or $V_{IM}$
ERC	250 ps	$V_{IH}$

The configuration pins each have internal pull-up and pull-down resistors of 100 k $\Omega$  each. Thus, the recommendation is an external pull-up/pull-down resistors of about 10 k $\Omega$  each, to meet the requirement of the threshold levels for the  $V_{IL}$  and  $V_{IH}$  listed in the [Electrical Characteristics](#) table. The external resistors shown in [Figure 18](#) should be populated to produce corresponding configuration settings, according to the list given in [Table 17](#).

**Table 17. Resistor Parameters**

RESISTOR NAME	VALUE
R1	Leave unpopulated
R2	Leave unpopulated
R3	Leave unpopulated
R4	Leave unpopulated
R5	Leave unpopulated
R6	10 k $\Omega$ (EQ = 0 dB) or Leave unpopulated (EQ = 2.5 dB)
R7	10 k $\Omega$
R8	Leave unpopulated

### 8.2.2.1 Reset Implementation

The DPHY440 RSTN input gives control over the device reset and to place the device into low power mode. It is critical to reset the digital logic of the DPHY440 after the VCC supply is stable (that is, the power supply has reached the minimum recommended operating voltage). This is achieved by transitioning the RSTN input from a low level to a high level. A system may provide a control signal to the RSTN signal that transitions low to high after the power supply is (or supplies are) stable, or implement an external capacitor connected between RSTN and GND, to allow delaying the RSTN signal during power up. Both implementations are shown in Figure 19 and Figure 20.

Figure 19. External Capacitor Controlled RSTN

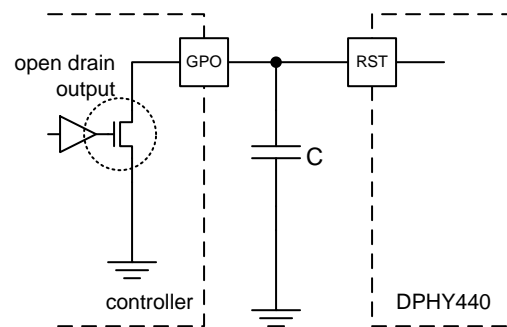

Figure 20. RSTN Input from Active Controller

When implementing the external capacitor, the size of the external capacitor depends on the power up ramp of the VCC supply, where a slower ramp-up results in a larger value external capacitor.

Refer to the latest reference schematic for the DPHY440 device and/or consider approximately 200-nF capacitor as a reasonable first estimate for the size of the external capacitor.

When implementing an RSTN input from an active controller, it is recommended to use an open drain driver if the RSTN input is driven. This protects the RSTN input from damage of an input voltage greater than VCC.

Figure 21. Power-Up Timing Requirements

Table 18. Timing Requirements

	DESCRIPTION <sup>(1)</sup>	MIN	MAX
t <sub>D1</sub>	V <sub>CC</sub> stable before de-assertion of RSTN.	100 μs	
t <sub>SU2</sub>	Setup of VSADJ_CFG0, PRE_CFG1, EQ and ERC pin before de-assertion of RSTN.	0	
t <sub>H2</sub>	Hold of VSADJ_CFG0, PRE_CFG1, EQ and ERC pin after de-assertion of RSTN.	250 μs	
t <sub>VCC_RAMP</sub>	V <sub>CC</sub> supply ramp requirements	0.2 ms	100 ms

(1) Unused DAXP/N pins shall be tied to GND.

### 8.2.3 Application Curves

## 9 Power Supply Recommendations

Texas Instruments recommends a 0.1- $\mu$ F capacitor on each power pin.

Figure 24. Supply Implementation

## 10 Layout

### 10.1 Layout Guidelines

- DAXP/N and DB\*P/N pairs should be routed with controlled 100-Ω differential impedance ( $\pm 15\%$ ) or 50-Ω single-ended impedance ( $\pm 15\%$ ).
- Keep away from other high speed signals.
- Keep lengths to within 5 mils of each other.
- Length matching should be near the location of mismatch.
- Each pair should be separated at least by 3 times the signal trace width.
- The use of bends in differential traces should be kept to a minimum. When bends are used, the number of left and right bends should be as equal as possible and the angle of the bend should be  $\geq 135$  degrees. This will minimize any length mismatch causes by the bends and; therefore, minimize the impact bends have on EMI.
- Route all differential pairs on the same of layer.
- The number of VIAS should be kept to a minimum. It is recommended to keep the VIAS count to 2 or less.
- Keep traces on layers adjacent to ground plane.
- Do NOT route differential pairs over any plane split.
- Adding Test points will cause impedance discontinuity and will; therefore, negatively impact signal performance. If test points are used, they should be placed in series and symmetrically. They must not be placed in a manner that causes a stub on the differential pair.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) **MSL, Peak Temp.** - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) **Lead finish/Ball material** - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
