1 General Description

ZETTA eMMC is an embedded MMC solution designed in a BGA package form. eMMC operation is identical to a MMC device and therefore is a simple read and write to memory using MMC protocol v5.1 which is a industry standard.

eMMC consists of NAND flash and a MMC controller. 3V supply voltage is required for the NAND area (VDDF or VCC) whereas 1.8V or 3V dual supply. voltage (VDD or VCCQ) is supported for the MMC controller. ZETTA eMMC supports HS400 in order to improve sequential bandwidth, especially sequential read performance.

There are several advantages of using eMMC. It is easy to use as the MMC interface allows easy integration with any microprocessor with MMC host. Any revision or amendment of NAND is invisible to the host as the embedded MMC controller insulates NAND technology from the host. This leads to faster product development as well as faster times to market.

The embedded flash management software of eMMC manages Wear Leveling, Bad Block Management and ECC.

2 Product List

Part Number	Density	Flash Type	PackageType	Package size
ZDEMDCM004G-BG25	4GB	MLC	FBGA153	11.5x13x1.0 (mm)
ZDEMDCM008G-CG25	8GB	MLC	FBGA153	11.5x13x1.0 (mm)

3 Key Features

- e•MMC v5.1 compatible. Detail description is referenced by JEDEC Standard
 - (Backward compatible to e•MMC v4.5 to v5.0)
- Bus mode
 - Data bus width: 1bit(default), 4bit and 8bit
 - Data transfer rate: up to 400MB/s (HS400) @ 200MHz DDR with 8bit bus width
 - MMC I/F Clock Frequency: 0~200MHz
 - MMC I/F Boot Frequency: 0~52MHz
- Operating Voltage Range
 - VCC (NAND/Core): 2.7V ~ 3.6V
 - VCCQ (CTRL/IO): 1.7V ~ 1.95V / 2.7V ~ 3.6V
- Temperature
 - Operation (-25°C ~ 85°C)
 - Storage without operation (-40°C ~ 85°C)

➤ **Device type values (EXT_CSD Register : DEVICE_TYPE [196])**

Bit	Device Type	Supportability
7	HS400 Dual Data Rate e•MMC @ 200 MHz - 1.2V I/O	Not support
6	HS400 Dual Data Rate e•MMC @ 200 MHz - 1.8V I/O	Support
5	HS200 Single Data Rate e•MMC @ 200 MHz - 1.2V I/O	Not support
4	HS200 Single Data Rate e•MMC @ 200 MHz - 1.8V I/O	Support
3	High-Speed Dual Data Rate e•MMC @ 52MHz - 1.2V I/O	Not support
2	High-Speed Dual Data Rate e•MMC @ 52MHz - 1.8V or 3V I/O	Support
1	High-Speed e•MMC @ 52MHz - at rated device voltage(s)	Support
0	High-Speed e•MMC @ 26MHz - at rated device voltage(s)	Support

Note: It is being discussed in JEDEC and is not confirmed yet. It can be modified according to JEDEC standard in the future.

➤ **Extended CSD revisions (EXT_CSD Register : EXT_CSD_REV [192])**

Value	Timing Interface	EXT_CSD Register Value
255–9	Reserved	-
8	Revision 1.8 (for MMC v5.1)	Support
7	Revision 1.7 (for MMC V5.0)	-
6	Revision 1.6 (for MMC V4.5, V4.51)	-
5	Revision 1.5 (for MMC V4.41)	-
4	Revision 1.4 (Obsolete)	-
3	Revision 1.3 (for MMC V4.3)	-
2	Revision 1.2 (for MMC V4.2)	-
1	Revision 1.1 (for MMC V4.1)	-
0	Revision 1.0 (for MMC V4.0)	-

Note: Current e•MMC standard defined by JEDEC supports up to 0x08 for EXT_CSD_REV value.

➤ **High Speed timing values (EXT_CSD Register: HS_TIMING [185])**

Value	Timing Interface	Supportability
0x0	Selecting backwards compatibility interface timing	Support
0x1	High Speed	Support
0x2	HS200	Support
0x3	HS400	Support

4 Pin Description

4.1 eMMC 153 Ball Pin Assignment

Ball No.	Name	Ball No.	Name	Ball No.	Name	Ball No.	Name
A3	DAT0	C2	VDDi	J5	Vss	N4	Vccq
A4	DAT1	C4	Vssq	J10	Vcc	N5	Vssq
A5	DAT2	C6	Vccq	K5	RST_n	P3	Vccq
A6	Vss	E6	Vcc	K8	Vss	P4	Vssq
B2	DAT3	E7	Vss	K9	Vcc	P5	Vccq
B3	DAT4	F5	Vcc	M4	Vccq	P6	Vssq
B4	DAT5	G5	Vss	M5	CMD	--	--
B5	DAT6	H5	DS	M6	CLK	--	--
B6	DAT7	H10	Vss	N2	Vssq	--	--

Note:

NC: No Connect, can be connected to ground or left floating.

RFU: Reserved for Future Use, should be left floating for future use.

VSF: Vendor Specific Function, shall be left floating.

4.2 eMMC Pin Description

Signal	Ball No.	Description
CLOCK (CLK)	M6	Each cycle of the clock directs a transfer on the command line and on the data lines.
COMMAND (CMD)	M5	This signal is a bidirectional command channel used for device initialization and command transfer. The CMD Signal has 2 operation modes: open drain for initialization, and push-pull for fast command transfer.
DATA (DAT0-DAT7)	A3~A5 B2~B6	These are bidirectional data channels. The DAT signals operate in push-pull mode.
RST_n	K5	Hardware Reset Input
DS	H5	Data Strobe: Return Clock signal used in HS400 mode
V _{CCQ}	C6,M4,N4,P3,P5	Power supply for MMC interface and Controller, have two power mode: High power mode:2.7V~3.6V; Lower power mode:1.7V~1.95V
V _{CC}	E6,F5,J10,K9	Power supply for NAND flash memory, its power voltage range is: 2.7V~3.6V
VDDi	C2	VDDi is internal power mode. Connect 1uF or 2.2uF capacitor from VDDi to ground
V _{SS} ,V _{SSQ}	A6, E7, G5, H10, J5, J8,C4,N2,P4,P6	Ground lines

Note: All other pins are not connected [NC] and can be connected to GND or left floating.

5 DC Electrical Characteristics

5.1 General operating conditions

7 Parameter	Symbol	Min	Max	Unit	Remarks
Peak voltage on all lines	--	-0.5	V _{CCQ} +0.5	V	--
All Inputs					
Input Leakage Current (before initialization sequence and/or the internal pull up resistors connected)	--	-100	100	uA	--
Input Leakage Current (after initialization sequence and the internal pull up resistors disconnected)	--	-2	2	uA	--
All Outputs					
Output Leakage Current (before initialization sequence)	--	-100	100	uA	--
Output Leakage Current (after initialization sequence)	--	-2	2	uA	--

Note: Initialization sequence is defined in Power-Up chapter of JEDEC/MMCA Standard.

5.2 Operating Current (RMS)

➤ Active Power Consumption during operation

Power Consumption	4GB	8GB	Units
HS400 Read VCC	50	61	mA
HS400 Read VCCQ	162	189	mA
HS400 Write VCC	20	26	mA
HS400 Write VCCQ	83	92	mA

Note:

- Temperature: 25°C
- V_{CC}=3.3V, V_{CCQ}=1.8V
- Not 100% tested

5.3 Power supply voltage

Parameter	Symbol	Test Conditions	Min	Max	Unit
Supply voltage1 (NAND/Core)	V _{CC}	--	2.7	3.6	V
Supply voltage 2 (CTRL/IO)	V _{CCQ}	--	1.7	1.95	V
			2.7	3.6	V

5.4 Standby Power Consumption

Power Consumption	4GB	8GB	Units
Standby(VCCQ & VCC on)	150	170	uA

Note:

- Power measurement conditions: Bus configuration =x8, No CLK
- V_{CC}=3.3V, V_{CCQ}=1.8V
- Not 100% tested

5.5 Sleep Power Consumption

Sleep Power Consumption in Sleep State

Power Consumption	4GB	8GB	Units
Sleep (VCCQ on, VCC off)	90	90	uA

Note:

- Power measurement conditions: Bus configuration = x8, No CLK
- Enter sleep state by CMD5, V_{CC} power is switched off, V_{CCQ}=1.8V
- Not 100% tested

5.6 Bus Signal Line Loading

The total capacitance C_L of each line of the e•MMC bus is the sum of the bus master capacitance C_{HOST} , the bus capacitance C_{BUS} itself and the capacitance C_{DEVICE} of the e•MMC connected to this line:

$$C_L = C_{HOST} + C_{BUS} + C_{DEVICE}$$

The sum of the host and bus capacitances should be under 20pF.

Bus Signal Line Load

Parameter	Symbol	Min	Typ.	Max	Unit	Remark
Pull-up resistance for CMD	R_{CMD}	4.7	--	100	k Ω	to prevent bus floating
Pull-up resistance for DAT0–7	R_{DAT}	10	--	100	k Ω	to prevent bus floating
Internal pull up resistance DAT1–DAT7	R_{int}	10	--	150	k Ω	to prevent unconnected lines floating
Bus signal line capacitance	C_L	--	--	30	pF	Single Device
Single Device capacitance	C_{DEVICE}	--	--	12	pF	Single Device capacitance
Maximum signal line inductance	--	--	--	16	nH	$f_{PP} \leq 52$ MHz

6 eMMC Register Description

Software designers should refer to the particular implementation to do the programming. This section introduces the registers in eMMC and the values that are used in ZETTA eMMC. The following table is the register list of current specification. The detail functionality is not described here; please reference to latest eMMC specifications.

6.1 Operation Conditions Register (OCR) Register

The 32-bit operation conditions register (OCR) stores the VDD voltage profile of the Device and the access mode indication. In addition, this register includes a status information bit. This status bit is set if the Device power up procedure has been finished. The OCR register shall be implemented by all Devices.

OCR bit	V _{CCQ} voltage window	e.MMC
[6:0]	Reserved	000 0000b
[7]	1.7–1.95	1b
[14:8]	2.0–2.6	000 0000b
[23:15]	2.7–3.6	1 1111 1111b
[28:24]	Reserved	000 0000b
[30:29]	Access Mode	00b (byte mode) 10b (sector mode)
[31]	Card power up status bit (busy)*	

Note*: This bit is set to LOW if the e•MMC has not finished the power up routine. The supported voltage range is coded as shown in table.

6.2 SD Card Identification Register (CID)

The Device IDentification (CID) register is 128 bits wide. It contains the Device identification information used during the Device identification phase (e•MMC protocol). Every individual flash or I/O Device shall have a unique identification number. Every type of e•MMC Devices shall have a unique identification number. Table 75 lists these identifiers. The structure of the CID register is defined in this section.

Name	Field	Width	CID-slice	CID Value
Manufacturer ID	MID	8	[127:120]	E7h
Reserved	-	6	[119:114]	0
Card/BGA	CBX	2	[113:112]	01
OEM/Application ID	OID	8	[111:104]	11h
Product name	PNM	48	[103:56]	ZD008G
Product revision	PRV	8	[55:48]	FFh
Product serial number	PSN	32	[47:16]	Serial number
Manufacturing date	MDT	8	[15:8]	Manufacturing date
CRC7 checksum	CRC	7	[7:1]	0
Not used, always '1'	-	1	[0:0]	1

6.3 Driver Stage Register (DSR)

The 16-bit driver stage register (DSR) is optionally used to improve the bus performance for extended operating conditions. The CSD register carries the information about the DSR register usage. The default value of the DSR register is 0x404.

6.4 Relative Card Address Register (RCA)

The writable 16-bit relative Device address (RCA) register carries the Device address assigned by the host during the Device identification. This address is used for the addressed host-Device communication after the Device identification procedure. The default value of the RCA register is 0x0001. The value 0x0000 is reserved to set all Devices into the Stand-by State with CMD7.

6.5 Card Specific Data Register (CSD)

The Card-Specific Data register provides information on how to access the eMMC contents. The CSD defines the data format, error correction type, maximum data access time, data transfer speed, whether the DSR register can be used etc. The programmable part of the register (entries marked by W or E, see below) can be changed by CMD27. The type of the entries in the table below is coded as follows:

- R: Read only
- W: One time programmable and not readable.
- R/W: One time programmable and readable.
- W/E: Multiple writable with value kept after power failure, H/W reset assertion and any CMD0 reset and not readable.
- R/W/E: Multiple writable with value kept after power failure, H/W reset assertion and any CMD0 reset and readable.
- R/W/C_P: Writable after value cleared by power failure and HW/ rest assertion (the value not cleared by CMD0 reset) and readable.
- R/W/E_P: Multiple writable with value reset after power failure, H/W reset assertion and any CMD0 reset and readable.
- W/E/_P: Multiple writable with value reset after power failure, H/W reset assertion and any CMD0 reset and not readable.

Name	Field	Width	Cell Type	CSD-slice	Value
CSD structure	CSD_STRUCTURE	2	R	[127:126]	3h

Not used, always '1'	-	1	-	[0:0]	1h

6.6 Extended CSD register

The Extended CSD register defines the e•MMC properties and selected modes. It is 512 bytes long.

The most significant 320 bytes are the Properties segment, which defines the e•MMC capabilities and cannot be modified by the host. The lower 192 bytes are the Modes segment, which defines the configuration the e•MMC is working in. These modes can be changed by the host by means of the SWITCH command.

- R: Read only
- W: One time programmable and not readable.
- R/W: One time programmable and readable.
- W/E: Multiple writable with value kept after power failure, H/W reset assertion and any CMD0 reset and not readable.
- R/W/E: Multiple writable with value kept after power failure, H/W reset assertion and any CMD0 reset and readable.
- R/W/C_P: Writable after value cleared by power failure and HW/ rest assertion (the value not cleared by CMD0 reset) and readable.
- R/W/E_P: Multiple writable with value reset after power failure, H/W reset assertion and any CMD0 reset and readable.
- W/E/_P: Multiple writable with value reset after power failure, H/W reset assertion and any CMD0 reset and not readable.

7 Production Specifications

7.1 Performance

HS400 Performance	4GB	8GB	Units
Sequential Read	188	230	MB/s
Sequential Write	64	121	MB/s
Random Read	3419	3674	IOPS
Random Write	2154	1980	IOPS

7.2 Power Consumption

Operating Current

Power Consumption	4GB	8GB	Units
HS400 Read VCC	50	61	mA
HS400 Read VCCQ	162	189	mA
HS400 Write VCC	20	26	mA
HS400 Write VCCQ	83	92	mA

Note:

- Power measurement conditions: Bus configuration =x8 @200MHz DDR
- Max RMS current is the average RMS current consumption over a period of 100ms.
- Temperature: 25°C
- Vcc=3.3V, Vccq=1.8V
- Not 100% tested

Standby Power Consumption

Power Consumption	4GB	8GB	Units
Standby(VCCQ & VCC on)	150	170	uA

Note:

- Power measurement conditions: Bus configuration =x8, No CLK
- Vcc=3.3V, Vccq=1.8V
- Not 100% tested

Sleep Power Consumption

Power Consumption	4GB	8GB	Units
Sleep (VCCQ on, VCC off)	90	90	uA

Note:

- Power measurement conditions: Bus configuration = x8, No CLK
- Enter sleep state by CMD5, Vcc power is switched off, Vccq=1.8V
- Not 100% tested

9 Partition Configuration

9.1 Partition Management

The memory configuration initially consists (before any partitioning operation) of the User Data Area and RPMB Area Partitions and two Boot Area Partitions.

The embedded device also offers the host the possibility to configure additional local memory partitions with independent address spaces, starting from logical address 0x00000000, for different usage models.

Therefore, the memory block areas can be classified as follows:

- Two Boot Area Partitions, whose size is multiple of 128 KB and where booting from eMMC can be performed.
- One RPMB Partition accessed through a trusted mechanism, whose size is defined as multiple of 128 KB.
- Four General Purpose Area Partitions to store sensitive data or for other host usage models, whose sizes are a multiple of a Write Protect Group.

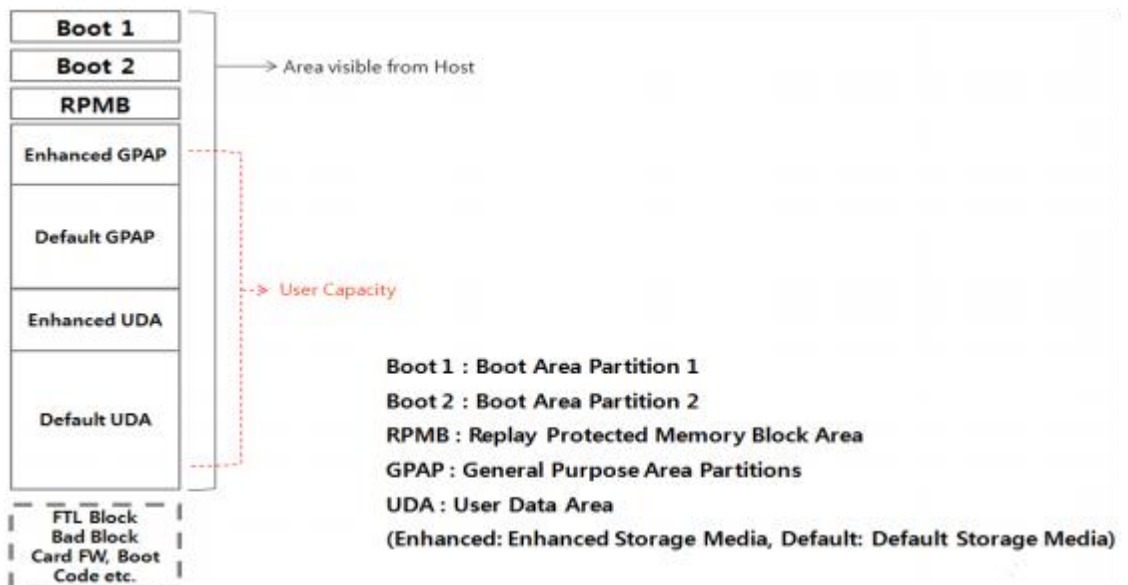

Boot and RPMB Area Partitions' sizes and attributes are defined by the memory manufacturer (read-only), while General Purpose Area Partitions' sizes and attributes can be programmed by the host only once in the device life-cycle (one-time programmable).

Moreover, the host is free to configure one segment in the User Data Area to be implemented as enhanced storage media, and to specify its starting location and size in terms of Write Protect Groups. The attributes of this Enhanced User Data Area can be programmed only once during the device life-cycle (one-time programmable).

A possible final configuration can be the following:

9.2 User Density

➤ **Boot and RPMB Size**

Capacity	Boot1 Size	Boot2 Size	RPMB Size
4GB/8GB	4MB	4MB	4MB

 ➤ **User Density Size**

Capacity	User Area Capacity	SEC_COUNT in Extended CSD
4GB	3700MB	0X73A000
8GB	7400MB	0XE74000

 ➤ **Maximum Enhanced Partition Size**

Capacity	Max. Enhanced Partition Size	MAX_ENH_SIZE_MULT	HC_WP_GRP_SIZE	HC_ERASE_GRP_SIZE
4GB	1840MB	0X73	0X20	0X01
8GB	3696MB	0XE7	0X20	0X01

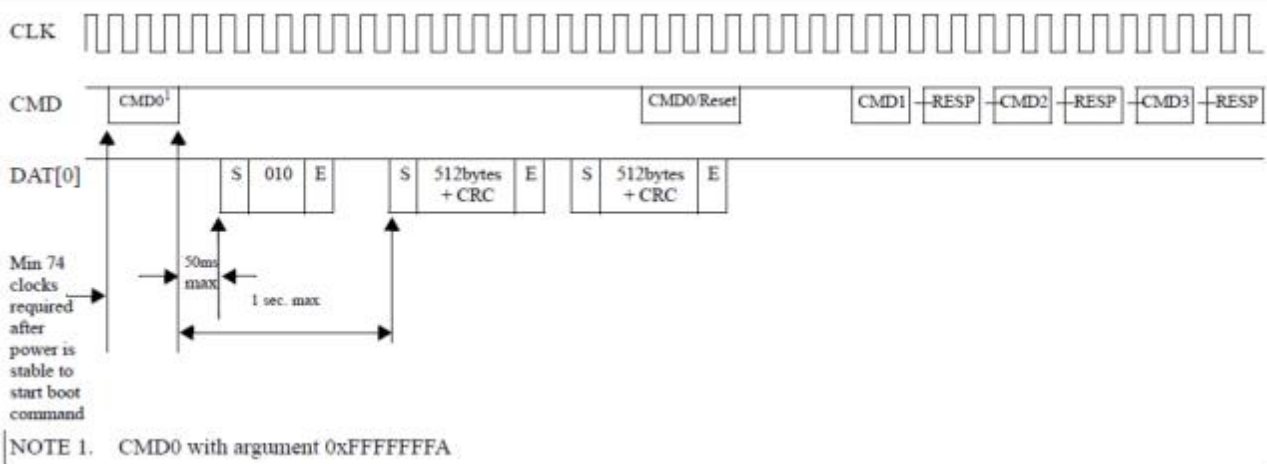

Max Enhanced Area = MAX_ENH_SIZE_MULT x HC_WP_GRP_SIZE x HC_ERASE_GRP_SIZE x 512kBytes

9.3 Boot Operation Mode

In boot operation mode, the master can read boot data from the slave (device) by keeping CMD line low or sending CMD0 with argument + 0xFFFFFFFF, before issuing CMD1. The data can be read from either boot area or user area depending on register setting.

Boot operation complete Clock = 400 kHz
 (Compatible with the description which $\leq 400\text{kHz}$)

NOTE 1. CMD0 with argument 0xFFFFFFFF
