

1. DESCRIPTION

These four-bit magnitude comparators perform comparison of straight binary and straight BCD(8-4-2-1)codes.Three fully decoded decisions about two 4-bit word (A,B) are made and externally available at three outputs.These devices are fully expandable to any number of bits without external gates.Words of greater length may be compared by connecting comparators in cascade.The A> B,A< B, and A=B outputs of a stage handling less-significant bits are connected to the corresponding A> B,A< B, and A=B inputs of the next stage handling more-significant bits.The stage handling the least-significant bits must have a high-level voltage applied to the A=B input.The cascading paths of the 74LS85 are implemented with only a two-gate-level delay to reduce overall comparison times for long words.An alternate method of cascading which further reduces the comparison time is shown in the typical application data.

6. ABSOLUTE MAXIMUM RATINGS OVER OPERATING FREE-AIR TEMPERATURE RANGE (UNLESS OTHERWISE NOTES)

Supply voltage, V_{CC} 7V

Input voltage, VI : 74LS85..... 7V

Operating free-air temperature range: DIP package..... 0°C to 70°C

Storage temperature range, T_{STG} -65°C to 150°C

[†] Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
