

AMC1350-Q1 Automotive, Precision, ± 5 -V Input, Reinforced Isolated Amplifier

1 Features

- AEC-Q100 qualified for automotive applications:
 - Temperature grade 1: -40°C to $+125^{\circ}\text{C}$, T_A
- **Functional Safety-Capable**
 - [Documentation available to aid functional safety system design](#)
- Linear input voltage range: $\pm 5\text{ V}$
- High input impedance: $1.25\text{ M}\Omega$ (typ)
- Fixed gain: 0.4 V/V
- Low DC errors:
 - Offset error $\pm 1.5\text{ mV}$ (max)
 - Offset drift: $\pm 15\text{ }\mu\text{V}/^{\circ}\text{C}$ (max)
 - Gain error: $\pm 0.2\%$ (max)
 - Gain drift: $\pm 35\text{ ppm}/^{\circ}\text{C}$ (max)
 - Nonlinearity $\pm 0.02\%$ (max)
- Operation on high-side and low-side: 3.3 V or 5 V
- High CMTI: $100\text{ kV}/\mu\text{s}$ (min)
- Fail-safe output
- Safety-related certifications:
 - $7070\text{-V}_{\text{PK}}$ reinforced isolation per DIN VDE V 0884-11: 2017-01
 - $5000\text{-V}_{\text{RMS}}$ isolation for 1 minute per UL1577

2 Applications

- Isolated voltage sensing in:
 - [Traction inverters](#)
 - [Onboard chargers](#)
 - [DC/DC converters](#)
 - [HEV/EV DC chargers](#)

3 Description

The AMC1350-Q1 is a precision, isolated amplifier with an output separated from the input circuitry by an isolation barrier that is highly resistant to magnetic interference. This barrier is certified to provide reinforced galvanic isolation of up to 5 kV_{RMS} according to VDE V 0884-11 and UL1577, and supports a working voltage of up to $1.5\text{ kV}_{\text{RMS}}$.

The isolation barrier separates parts of the system that operate on different common-mode voltage levels and protects the low-voltage side from potentially harmful voltages and damage.

The high-impedance input of the AMC1350-Q1 is optimized for connection to high-impedance resistive dividers or other voltage signal sources with high output resistance. The excellent accuracy and low temperature drift supports accurate AC and DC voltage sensing in onboard chargers (OBC), DC/DC converters, traction inverters, or other applications that must support high common-mode voltages.

The AMC1350-Q1 is offered in a wide-body 8-pin SOIC package and is AEC-Q100 qualified for automotive applications and supports the temperature range from -40°C to $+125^{\circ}\text{C}$

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
AMC1350-Q1	SOIC (8)	5.85 mm \times 7.50 mm

DATE	REVISION	NOTES
December 2021	*	Initial Release

5 Pin Configuration and Functions

Figure 5-1. DWV Package, 8-Pin SOIC, Top View

Table 5-1. Pin Functions

PIN		TYPE	DESCRIPTION
NO.	NAME		
1	VDD1	High-side power	High-side power supply ⁽¹⁾
2	INP	Analog input	Noninverting analog input. Either INP or INN must have a DC current path to GND1 to define the common-mode input voltage. ⁽²⁾
3	INN	Analog input	Inverting analog input. Either INP or INN must have a DC current path to GND1 to define the common-mode input voltage. ⁽²⁾
4	GND1	High-side ground	High-side analog ground
5	GND2	Low-side ground	Low-side analog ground
6	OUTN	Analog output	Inverting analog output
7	OUTP	Analog output	Noninverting analog output
8	VDD2	Low-side power	Low-side power supply ⁽¹⁾

(1) See the [Power Supply Recommendations](#) section for power-supply decoupling recommendations.

(2) See the [Layout](#) section for details.

6 Specifications

6.1 Absolute Maximum Ratings

see⁽¹⁾

		MIN	MAX	UNIT
Power-supply voltage	High-side VDD1 to GND1	-0.3	6.5	V
	Low-side VDD2 to GND2	-0.3	6.5	
Analog input voltage	INP, INN	-15	15	V
Analog output voltage	OUTP, OUTN	GND2 - 0.5	VDD2 + 0.5	V
Input current	Continuous, any pin except power-supply pins	-10	10	mA
Temperature	Junction, T _J		150	°C
	Storage, T _{stg}	-65	150	

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾ , HBM ESD classification level 2	±2000	V
		Charged-device model (CDM), per AEC Q100-011, CDM ESD classification level C6	±1000	

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

				MIN	NOM	MAX	UNIT
POWER SUPPLY							
VDD1	High-side power-supply	VDD1 to GND1		3	5	5.5	V
VDD2	Low-side power-supply	VDD2 to GND2		3	3.3	5.5	V
ANALOG INPUT							
V _{Clipping}	Input voltage before clipping output	V _{IN} = V _{INP} - V _{INN}		±6.25			V
V _{FSR}	Specified linear full-scale voltage	V _{IN} = V _{INP} - V _{INN}		-5		5	V
V _{CM}	Operating common-mode input voltage			-4		4	V
ANALOG OUTPUT							
C _{LOAD}	Capacitive load	On OUTP or OUTN to GND2				500	pF
		OUTP to OUTN				250	
R _{LOAD}	Resistive load	On OUTP or OUTN to GND2			10	1	kΩ
TEMPERATURE RANGE							
T _A	Specified ambient temperature			-40		125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		AMC1350-Q1	UNIT
		DWV (SOIC)	
		8 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	84.6	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	28.3	°C/W
R _{θJB}	Junction-to-board thermal resistance	41.1	°C/W
ψ _{JT}	Junction-to-top characterization parameter	4.9	°C/W
ψ _{JB}	Junction-to-board characterization parameter	39.1	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	n/a	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Power Ratings

PARAMETER		TEST CONDITIONS	VALUE	UNIT
P _D	Maximum power dissipation (both sides)	VDD1 = VDD2 = 5.5 V	96	mW
P _{D1}	Maximum power dissipation (high-side)	VDD1 = 3.6 V	29	mW
		VDD1 = 5.5 V	51	
P _{D2}	Maximum power dissipation (low-side)	VDD2 = 3.6 V	26	mW
		VDD2 = 5.5 V	45	

6.6 Insulation Specifications

over operating ambient temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	VALUE	UNIT
GENERAL				
CLR	External clearance ⁽¹⁾	Shortest pin-to-pin distance through air	≥ 8.5	mm
CPG	External creepage ⁽¹⁾	Shortest pin-to-pin distance across the package surface	≥ 8.5	mm
DTI	Distance through insulation	Minimum internal gap (internal clearance) of the double insulation	≥ 0.021	mm
CTI	Comparative tracking index	DIN EN 60112 (VDE 0303-11); IEC 60112	≥ 600	V
	Material group	According to IEC 60664-1	I	
	Overvoltage category per IEC 60664-1	Rated mains voltage ≤ 600 V _{RMS}	I-IV	
		Rated mains voltage ≤ 1000 V _{RMS}	I-III	
DIN VDE V 0884-11 (VDE V 0884-11): 2017-01				
V _{IORM}	Maximum repetitive peak isolation voltage	At AC voltage	2120	V _{PK}
V _{IOWM}	Maximum-rated isolation working voltage	At AC voltage (sine wave)	1500	V _{RMS}
		At DC voltage	2120	V _{DC}
V _{IOTM}	Maximum transient isolation voltage	V _{TEST} = V _{IOTM} , t = 60 s (qualification test)	7070	V _{PK}
		V _{TEST} = 1.2 × V _{IOTM} , t = 1 s (100% production test)	8480	
V _{IOSM}	Maximum surge isolation voltage ⁽²⁾	Test method per IEC 60065, 1.2/50-μs waveform, V _{TEST} = 1.6 × V _{IOSM} = 12800 V _{PK} (qualification)	8000	V _{PK}
q _{pd}	Apparent charge ⁽³⁾	Method a, after input/output safety test subgroups 2 and 3, V _{ini} = V _{IOTM} , t _{ini} = 60 s, V _{pd(m)} = 1.2 × V _{IORM} , t _m = 10 s	≤ 5	pC
		Method a, after environmental tests subgroup 1, V _{ini} = V _{IOTM} , t _{ini} = 60 s, V _{pd(m)} = 1.6 × V _{IORM} , t _m = 10 s	≤ 5	
		Method b1, at routine test (100% production) and preconditioning (type test), V _{ini} = V _{IOTM} , t _{ini} = 1 s, V _{pd(m)} = 1.875 × V _{IORM} , t _m = 1 s	≤ 5	
C _{IO}	Barrier capacitance, input to output ⁽⁴⁾	V _{IO} = 0.5 V _{PP} at 1 MHz	~1.5	pF
R _{IO}	Insulation resistance, input to output ⁽⁴⁾	V _{IO} = 500 V at T _A = 25°C	> 10 ¹²	Ω
		V _{IO} = 500 V at 100°C ≤ T _A ≤ 125°C	> 10 ¹¹	
		V _{IO} = 500 V at T _S = 150°C	> 10 ⁹	
	Pollution degree		2	
	Climatic category		55/125/21	
UL1577				
V _{ISO}	Withstand isolation voltage	V _{TEST} = V _{ISO} = 5000 V _{RMS} or 7071 V _{DC} , t = 60 s (qualification), V _{TEST} = 1.2 × V _{ISO} = 6000 V _{RMS} , t = 1 s (100% production test)	5000	V _{RMS}

- (1) Apply creepage and clearance requirements according to the specific equipment isolation standards of an application. Care must be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed circuit board (PCB) do not reduce this distance. Creepage and clearance on a PCB become equal in certain cases. Techniques such as inserting grooves, ribs, or both on a PCB are used to help increase these specifications.
- (2) Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.
- (3) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (4) All pins on each side of the barrier are tied together, creating a two-pin device.

6.7 Safety-Related Certifications

VDE	UL
Certified according to DIN VDE V 0884-11 (VDE V 0884-11): 2017-01, DIN EN 60950-1 (VDE 0805 Teil 1): 2014-08, and DIN EN 60065 (VDE 0860): 2005-11	Recognized under 1577 component recognition
Reinforced insulation	Single protection
Certificate number: pending	File number: E181974

6.8 Safety Limiting Values

Safety limiting⁽¹⁾ intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to over-heat the die and damage the isolation barrier potentially leading to secondary system failures.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I _S	Safety input, output, or supply current	R _{θJA} = 84.6°C/W, VDDx = 5.5 V, T _J = 150°C, T _A = 25°C			270	mA
		R _{θJA} = 84.6°C/W, VDDx = 3.6 V, T _J = 150°C, T _A = 25°C			410	
P _S	Safety input, output, or total power	R _{θJA} = 84.6°C/W, T _J = 150°C, T _A = 25°C			1480	mW
T _S	Maximum safety temperature				150	°C

- (1) The maximum safety temperature, T_S, has the same value as the maximum junction temperature, T_J, specified for the device. The I_S and P_S parameters represent the safety current and safety power, respectively. Do not exceed the maximum limits of I_S and P_S. These limits vary with the ambient temperature, T_A.

The junction-to-air thermal resistance, R_{θJA}, in the [Thermal Information](#) table is that of a device installed on a high-K test board for leaded surface-mount packages. Use these equations to calculate the value for each parameter:

T_J = T_A + R_{θJA} × P, where P is the power dissipated in the device.

T_{J(max)} = T_S = T_A + R_{θJA} × P_S, where T_{J(max)} is the maximum junction temperature.

P_S = I_S × VDD_{max}, where VDD_{max} is the maximum supply voltage for high-side and low-side.

6.9 Electrical Characteristics

minimum and maximum specifications apply from $T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$, $V_{DD1} = 3.0\text{ V}$ to 5.5 V , $V_{DD2} = 3.0\text{ V}$ to 5.5 V , $\text{INP} = -5\text{ V}$ to $+5\text{ V}$, and $\text{INN} = \text{GND1}$ (unless otherwise noted); typical specifications are at $T_A = 25^\circ\text{C}$, $V_{DD1} = 5\text{ V}$, and $V_{DD2} = 3.3\text{ V}$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
ANALOG INPUT						
V_{OS}	Offset voltage ⁽²⁾	$T_A = 25^\circ\text{C}$, $\text{INN} = \text{INP} = \text{GND1}$, $4.5\text{ V} \leq V_{DD1} \leq 5.5\text{ V}$ ⁽¹⁾	-1.5	± 0.3	1.5	mV
		$T_A = 25^\circ\text{C}$, $\text{INN} = \text{INP} = \text{GND1}$, $3.0\text{ V} \leq V_{DD1} \leq 5.5\text{ V}$ ⁽³⁾	-2.5	-0.8	2.5	
ΔV_{OS}	Offset voltage long-term stability	10 years at $T_A = 55^\circ\text{C}$		0 ⁽⁷⁾		mV
TCV_{OS}	Offset voltage thermal drift ⁽⁵⁾	$\text{INN} = \text{INP} = \text{GND1}$	-15	± 3	15	$\mu\text{V}/^\circ\text{C}$
ΔTCV_{OS}	Offset voltage thermal drift long-term stability	10 years at $T_A = 55^\circ\text{C}$, $\text{INN} = \text{INP} = \text{GND1}$		0 ⁽⁷⁾		$\text{mV}/^\circ\text{C}$
R_{IN}	Input resistance, differential		2	2.5	3	M Ω
	Input resistance, single ended	$\text{INN} = \text{GND1}$	1	1.25	1.5	
ΔR_{IN}	Input resistance long-term stability	10 years at $T_A = 55^\circ\text{C}$		0 ⁽⁷⁾		ppm
TCR_{IN}	Input resistance thermal drift	$-40^\circ\text{C} \leq T_A \leq 85^\circ\text{C}$		5		$\text{ppm}/^\circ\text{C}$
C_{IN}	Single-ended input capacitance	$\text{INN} = \text{HGND}$, $f_{IN} = 275\text{ kHz}$		4		pF
C_{IND}	Differential input capacitance	$f_{IN} = 275\text{ kHz}$		2		pF
ANALOG OUTPUT						
	Nominal gain			0.40		V/V
E_G	Gain error ⁽¹⁾	$T_A = 25^\circ\text{C}$	-0.2%	$\pm 0.05\%$	0.2%	
ΔE_G	Gain error long-term stability	10 years at $T_A = 55^\circ\text{C}$		0 ⁽⁷⁾		
TCE_G	Gain error thermal drift ^{(1) (6)}		-35	± 10	35	$\text{ppm}/^\circ\text{C}$
ΔTCE_G	Gain error thermal drift long-term stability	10 years at $T_A = 55^\circ\text{C}$		0 ⁽⁷⁾		$\text{ppm}/^\circ\text{C}$
	Nonlinearity ⁽¹⁾		-0.02%	$\pm 0.003\%$	0.02%	
	Nonlinearity thermal drift			0.2		$\text{ppm}/^\circ\text{C}$
THD	Total harmonic distortion ⁽⁴⁾	$V_{IN} = 10 V_{PP}$, $f_{IN} = 10\text{ kHz}$, $\text{BW} = 100\text{ kHz}$		-87		dB
SNR	Signal-to-noise ratio	$V_{IN} = 10 V_{PP}$, $f_{IN} = 1\text{ kHz}$, $\text{BW} = 10\text{ kHz}$	81	85		dB
		$V_{IN} = 10 V_{PP}$, $f_{IN} = 10\text{ kHz}$, $\text{BW} = 100\text{ kHz}$		75		
	Output noise	$\text{INN} = \text{INP} = \text{GND1}$, $\text{BW} = 100\text{ kHz}$		250		μV_{rms}
CMRR	Common-mode rejection ratio	DC, $\text{INN} = \text{INP}$, $V_{CM\ min} \leq V_{CM} \leq V_{CM\ max}$		-72		dB
		$f_{IN} = 10\text{ kHz}$, $\text{INN} = \text{INP} = 10 V_{PP}$		-71		
PSRR	Power-supply rejection ratio ⁽²⁾	PSRR vs V_{DD1} , DC		-67		dB
		PSRR vs V_{DD2} , DC		-80		
		PSRR vs V_{DD1} with 10-kHz, 100-mV ripple		-65		
		PSRR vs V_{DD2} with 10-kHz, 100-mV ripple		-64		
V_{CMout}	Output common-mode voltage		1.39	1.44	1.49	V
$V_{CLIPout}$	Clipping differential output voltage	$V_{OUT} = (V_{OUTP} - V_{OUTN})$, $V_{IN} > V_{Clipping}$		2.49		V
$V_{Fail-safe}$	Fail-safe differential output voltage	V_{DD1} undervoltage or V_{DD1} missing		-2.57	-2.5	V
BW	Output bandwidth		275	300		kHz
R_{OUT}	Output resistance	On OUTP or OUTN		< 0.2		Ω

6.9 Electrical Characteristics (continued)

minimum and maximum specifications apply from $T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$, $V_{DD1} = 3.0\text{ V}$ to 5.5 V , $V_{DD2} = 3.0\text{ V}$ to 5.5 V , $INP = -5\text{ V}$ to $+5\text{ V}$, and $INN = GND1$ (unless otherwise noted); typical specifications are at $T_A = 25^\circ\text{C}$, $V_{DD1} = 5\text{ V}$, and $V_{DD2} = 3.3\text{ V}$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
	Output short-circuit current	On OOTP or OUTN, sourcing or sinking, $INN = INP = GND1$, outputs shorted to either GND or VDD2		14		mA
CMTI	Common-mode transient immunity		100	150		kV/ μs
POWER SUPPLY						
VDD1 _{UV}	VDD1 undervoltage detection threshold	VDD1 rising	2.5	2.7	2.9	V
		VDD1 falling	2.4	2.6	2.8	
VDD2 _{UV}	VDD2 undervoltage detection threshold	VDD2 rising	2.2	2.45	2.65	V
		VDD2 falling	1.85	2.0	2.2	
I _{DD1}	High-side supply current	3.0 V < VDD1 < 3.6 V		6.0	8.1	mA
		4.5 V < VDD1 < 5.5 V		7.0	9.3	
I _{DD2}	Low-side supply current	3.0 V < VDD2 < 3.6 V		5.3	7.2	mA
		4.5 V < VDD2 < 5.5 V		5.9	8.1	

- (1) The typical value includes one standard deviation (*sigma*) at nominal operating conditions.
- (2) This parameter is input referred.
- (3) The typical value is at $V_{DD1} = 3.3\text{ V}$.
- (4) THD is the ratio of the rms sum of the amplitudes of first five higher harmonics to the amplitude of the fundamental.
- (5) Offset error temperature drift is calculated using the box method, as described by the following equation:

$$TCV_{OS} = (V_{OS,MAX} - V_{OS,MIN}) / TempRange$$
 where $V_{OS,MAX}$ and $V_{OS,MIN}$ refer to the maximum and minimum V_{OS} values measured within the temperature range (-40 to 125°C).
- (6) Gain error temperature drift is calculated using the box method, as described by the following equation:

$$TCE_G (ppm) = ((E_{G,MAX} - E_{G,MIN}) / TempRange) \times 10^4$$
 where $E_{G,MAX}$ and $E_{G,MIN}$ refer to the maximum and minimum E_G values (in %) measured within the temperature range (-40 to 125°C).
- (7) Value is below measurement capability.

6.10 Switching Characteristics

over operating ambient temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_r	Output signal rise time			1.3		μs
t_f	Output signal fall time			1.3		μs
	IN to OUTx signal delay (50% – 10%)	Unfiltered output		1	1.5	μs
	IN to OUTx signal delay (50% – 50%)	Unfiltered output		1.6	2.1	μs
	IN to OUTx signal delay (50% – 90%)	Unfiltered output		2.5	3	μs
t_{AS}	Analog settling time	VDD1 step to 3.0 V with VDD2 \geq 3.0 V, to V_{OUTP} and V_{OUTN} valid, 0.1% settling		500	800	μs

7 Detailed Description

7.1 Overview

The AMC1350-Q1 is a fully differential, precision, isolated amplifier with high input impedance. The input stage of the device consists of a fully differential amplifier that drives a second-order, delta-sigma ($\Delta\Sigma$) modulator. The modulator converts the analog input signal into a digital bitstream that is transferred across the isolation barrier that separates the high-side from the low-side. On the low-side, the received bitstream is processed by a fourth-order analog filter that outputs a differential signal at the OUPN and OUTP pins proportional to the input signal.

The SiO₂-based, capacitive isolation barrier supports a high level of magnetic field immunity, as described in the [ISO72x Digital Isolator Magnetic-Field Immunity application report](#). The digital modulation used in the AMC1350-Q1 to transmit data across the isolation barrier, and the isolation barrier characteristics itself, result in high reliability and common-mode transient immunity.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Analog Input

The single-ended, high-impedance input stage of the AMC1350-Q1 feeds a second-order, switched-capacitor, feed-forward $\Delta\Sigma$ modulator. The modulator converts the analog signal into a bitstream that is transferred across the isolation barrier, as described in the [Isolation Channel Signal Transmission](#) section.

There are two restrictions on the analog input signals INP and INN. First, if the input voltages V_{INP} or V_{INN} exceed the range specified in the [Absolute Maximum Ratings](#) table, the input currents must be limited to the absolute maximum value because the electrostatic discharge (ESD) protection turns on. In addition, the linearity and parametric performance of the device are ensured only when the analog input voltage remains within the linear full-scale range (V_{FSR}) and within the common-mode input voltage range (V_{CM}) as specified in the [Recommended Operating Conditions](#) table.

7.3.2 Isolation Channel Signal Transmission

The AMC1350-Q1 uses an on-off keying (OOK) modulation scheme, as shown in [Figure 7-1](#), to transmit the modulator output bitstream across the SiO₂-based isolation barrier. The transmit driver (TX) shown in the [Functional Block Diagram](#) transmits an internally-generated, high-frequency carrier across the isolation barrier to represent a digital *one* and does not send a signal to represent a digital *zero*. The nominal frequency of the carrier used inside the AMC1350-Q1 is 480 MHz.

The receiver (RX) on the other side of the isolation barrier recovers and demodulates the signal and provides the input to the fourth-order analog filter. The AMC1350-Q1 transmission channel is optimized to achieve the highest level of common-mode transient immunity (CMTI) and lowest level of radiated emissions caused by the high-frequency carrier and RX/TX buffer switching.

Figure 7-1. OOK-Based Modulation Scheme

7.3.3 Analog Output

The AMC1350-Q1 offers a differential analog output on the OUTP and OUTN pins. For differential input voltages ($V_{INP} - V_{INN}$) in the range from -5 V to $+5\text{ V}$, the device provides a linear response with a nominal gain of 0.4 V/V . For example, for a differential input voltage of 5 V , the differential output voltage ($V_{OUTP} - V_{OUTN}$) is 2 V . At zero input (INP shorted to INN), both pins output the same common-mode output voltage V_{CMout} , as specified in the [Electrical Characteristics](#) table. For absolute differential input voltages greater than 5 V but less than 5.75 V , the differential output voltage continues to increase in magnitude but with reduced linearity performance. The outputs saturate at a differential output voltage of $V_{CLIPout}$, as shown in [Figure 7-2](#), if the differential input voltage exceeds the $V_{Clipping}$ value.

Figure 7-2. Output Behavior of the AMC1350-Q1

The AMC1350-Q1 output offers a fail-safe feature that simplifies diagnostics on a system level. [Figure 7-2](#) shows the fail-safe condition, in which the AMC1350-Q1 outputs a negative differential output voltage that does not occur under normal operating conditions. The fail-safe output is active in two cases:

- When the high-side supply VDD1 of the AMC1350-Q1 device is missing
- When the high-side supply VDD1 falls below the undervoltage threshold $VDD1_{UV}$

Use the maximum $V_{Fail-safe}$ voltage specified in the [Electrical Characteristics](#) table as a reference value for fail-safe detection on a system level.

7.4 Device Functional Modes

The AMC1350-Q1 is operational when the power supplies VDD1 and VDD2 are applied as specified in the [Recommended Operating Conditions](#) table.

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The high input impedance, low input bias current, bipolar input voltage range, excellent accuracy, and low temperature drift make the AMC1350-Q1 a high-performance solution for automotive applications where isolated AC or DC voltage sensing is required.

8.2 Typical Application

Isolated amplifiers are widely used for voltage measurements in high-voltage applications that must be isolated from a low-voltage domain. Typical applications are AC line voltage measurements, either line-to-neutral or line-to-line in grid-connected equipment.

[Figure 8-1](#) illustrates a simplified schematic of an onboard charger (OBC) application that uses three AMC1350-Q1 devices to measure the AC line voltage on each phase of a three-phase system. The AC line voltage is divided down to an approximate ± 5 -V level across the bottom resistor (RSNS) of a high-impedance resistive divider that is sensed by the AMC1350-Q1. The output of the AMC1350-Q1 is a differential analog output voltage proportional to the input voltage but is galvanically isolated from the high-side by a reinforced isolation barrier. A common high-side power supply (VDD1) for all three AMC1350-Q1 devices is generated from the low-side supply (VDD2) of the system by an isolated DC/DC converter circuit. A low-cost solution is based on the push-pull driver [SN6501-Q1](#) and a transformer that supports the desired isolation voltage ratings.

The high-impedance input, high input voltage range, and the high common-mode transient immunity (CMTI) of the AMC1350-Q1 ensure reliable and accurate operation even in high-noise environments.

Figure 8-1. Using the AMC1350-Q1 for AC Line-Voltage Sensing in an OBC Application

8.2.1 Design Requirements

Table 8-1 lists the parameters for this typical application.

Table 8-1. Design Requirements

PARAMETER	120-V _{RMS} LINE VOLTAGE	230-V _{RMS} LINE VOLTAGE
System input voltage	120 V ±10%, 60 Hz	230 V ±10%, 50 Hz
High-side supply voltage	3.3 V or 5 V	3.3 V or 5 V
Low-side supply voltage	3.3 V or 5 V	3.3 V or 5 V
Maximum resistor operating voltage	75 V	75 V
Voltage drop across the sense resistor (RSNS) for a linear response	±5 V (maximum)	±5 V (maximum)
Current through the resistive divider, I _{CROSS}	100 µA	100 µA

8.2.2 Detailed Design Procedure

This discussion covers the 230-V_{RMS} example. The procedure for calculating the resistive divider for the 120-V_{RMS} use case is identical.

The 100-µA, cross-current requirement at peak input voltage (360 V) determines that the total impedance of the resistive divider is 3.6 MΩ. The impedance of the resistive divider is dominated by the top resistors (shown exemplary as R1 and R2 in Figure 8-1) and the voltage drop across RSNS can be neglected for a short time. The maximum allowed voltage drop per unit resistor is specified as 75 V; therefore, the total minimum number of unit resistors in the top portion of the resistive divider is 360 V / 75 V = 5. The calculated unit value is 3.6 MΩ / 5 = 720 kΩ and the next closest value from the E96 series is 715 kΩ.

The *effective* sense resistor value RSNS_{EFF} is the parallel combination of the external resistor RSNS and the input impedance of the AMC1350-Q1, R_{IN}. RSNS_{EFF} is sized such that the voltage drop across the impedance at maximum input voltage (360 V) equals the linear full-scale input voltage (V_{FSR}) of the AMC1350-Q1 (that is, +5 V). RSNS_{EFF} is calculated as $RSNS_{EFF} = V_{FSR} / (V_{Peak} - V_{FSR}) \times R_{TOP}$ where R_{TOP} is the total value of the top resistor string (5 × 715 kΩ = 3575 kΩ). The resulting value for RSNS_{EFF} is 9.96 kΩ. In a final step, RSNS is calculated as $RSNS = R_{IN} \times RSNS_{EFF} / (R_{IN} - RSNS_{EFF})$. With R_{IN} = 1.25 MΩ (typical), RSNS equals 52.47 kΩ and the next closest value from the E96 series is 52.3 kΩ.

Table 8-2 summarizes the design of the resistive divider.

Table 8-2. Resistor Value Examples

PARAMETER	120-V _{RMS} LINE VOLTAGE	230-V _{RMS} LINE VOLTAGE
Peak voltage	190 V	360 V
Unit resistor value, R _{TOP}	634 kΩ	715 kΩ
Number of unit resistors in R _{TOP}	3	5
Sense resistor value, RSNS	53.6 kΩ	52.3 kΩ
Total resistance value (R _{TOP} + RSNS)	1953.4 kΩ	3625.2 kΩ
Resulting current through resistive divider, I _{CROSS}	97.3 µA	99.3 µA
Resulting full-scale voltage drop across sense resistor RSNS	4.993 V	4.982 V
Peak power dissipated in R _{TOP} unit resistor	6 mW	7.1 mW
Total peak power dissipated in resistive divider	18.5 mW	35.7 mW

8.2.2.1 Input Filter Design

Placing an RC filter in front of the isolated amplifier improves signal-to-noise performance of the signal path. In practice, however, the impedance of the resistor divider is so high that adding a filter capacitor on the INN or INP pin limits the signal bandwidth to an unacceptable low limit, such that the filter capacitor is omitted. When used, design the input filter such that:

- The cutoff frequency of the filter is at least one order of magnitude lower than the sampling frequency (20 MHz) of the internal $\Delta\Sigma$ modulator
- The input bias current does not generate significant voltage drop across the DC impedance of the input filter

Most voltage-sensing applications use high-impedance resistor dividers in front of the isolated amplifier to scale down the input voltage. In that case, no additional resistor is needed and a single capacitor (as shown in [Figure 8-2](#)) is sufficient to filter the input signal.

Figure 8-2. Input Filter

8.2.2.2 Differential to Single-Ended Output Conversion

[Figure 8-3](#) shows an example of a [TLVx313-Q1](#)-based signal conversion and filter circuit for systems using single-ended input ADCs to convert the analog output voltage into digital. With $R1 = R2 = R3 = R4$, the output voltage equals $(V_{OUTP} - V_{OUTN}) + V_{REF}$. Tailor the bandwidth of this filter stage to the bandwidth requirement of the system and use NP0-type capacitors for best performance. For most applications, $R1 = R2 = R3 = R4 = 3.3\text{ k}\Omega$ and $C1 = C2 = 330\text{ pF}$ yields good performance.

Figure 8-3. Connecting the AMC1350-Q1 Output to a Single-Ended Input ADC

For more information on the general procedure to design the filtering and driving stages of SAR ADCs, see the [18-Bit, 1MSPS Data Acquisition Block \(DAQ\) Optimized for Lowest Distortion and Noise](#) and [18-Bit Data Acquisition Block \(DAQ\) Optimized for Lowest Power](#) reference guides, available for download at www.ti.com.

8.2.3 Application Curve

One important aspect of system design is the effective detection of an overvoltage condition to protect switching devices and passive components from damage. To power off the system quickly in the event of an overvoltage condition, a low delay caused by the isolated amplifier is required. Figure 8-4 shows the typical full-scale step response of the AMC1350-Q1.

Figure 8-4. Step Response of the AMC1350-Q1

8.3 What To Do and What Not To Do

Do not leave the inputs of the AMC1350-Q1 unconnected (floating) when the device is powered up. If the device inputs are left floating, the input bias current may drive the inputs to a positive or negative value that exceeds the operating common-mode input voltage and the device output is undetermined.

Connect the high-side ground (GND1) to INN, either by a hard short or through a resistive path. A DC current path between INN and GND1 is required to define the input common-mode voltage. Take care not to exceed the input common-mode range as specified in the *Recommended Operating Conditions* table. For best accuracy, route the ground connection as a separate trace that connects directly to the sense resistor rather than shorting GND1 to INN directly at the input to the device. See the *Layout* section for more details.

Do not connect protection diodes to the inputs (INP or INN) of the AMC1350-Q1. Diode leakage current can introduce significant measurement error especially at high temperatures. The input pin is protected against high voltages by its ESD protection circuit and the high impedance of the external resistive divider.

9 Power Supply Recommendations

In a typical application, the high-side power supply (VDD1) for the AMC1350-Q1 is generated from the low-side supply (VDD2) by an isolated DC/DC converter. A low-cost solution is based on the push-pull driver [SN6501](#) and a transformer that supports the desired isolation voltage ratings.

The AMC1350-Q1 does not require any specific power-up sequencing. The high-side power supply (VDD1) is decoupled with a low-ESR, 100-nF capacitor (C1) parallel to a low-ESR, 1- μ F capacitor (C2). The low-side power supply (VDD2) is equally decoupled with a low-ESR, 100-nF capacitor (C3) parallel to a low-ESR, 1- μ F capacitor (C4). Place all four capacitors (C1, C2, C3, and C4) as close to the device as possible. [Figure 9-1](#) shows a decoupling diagram for the AMC1350-Q1.

Figure 9-1. Decoupling of the AMC1350-Q1

Capacitors must provide adequate effective capacitance under the applicable DC bias conditions they experience in the application. Multilayer ceramic capacitors (MLCC) typically exhibit only a fraction of their nominal capacitance under real-world conditions and this factor must be taken into consideration when selecting these capacitors. This problem is especially acute in low-profile capacitors, in which the dielectric field strength is higher than in taller components. Reputable capacitor manufacturers provide capacitance versus DC bias curves that greatly simplify component selection.

10 Layout

10.1 Layout Guidelines

Figure 10-1 shows a layout recommendation with the critical placement of the decoupling capacitors (as close as possible to the AMC1350-Q1 supply pins) and placement of the other components required by the device. For best performance, place the sense resistor close to the device input pin (IN).

11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
AMC1350QDWVRQ1	ACTIVE	SOIC	DWV	8	1000	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 125	AMC1350Q	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
